Abstract

The 1991 Colombian constitution strengthened the checks and balances of the political system by enhancing the role of Congress and the Constitutional Court, while somewhat limiting the powers of the president (who nonetheless remains extremely powerful even for Latin American standards). As a consequence of the larger number of relevant players, and the removal of barriers that restricted political participation, the political system gained in terms of representation. However, political transaction costs increased, making cooperation harder to achieve. We show that this has been typically the case of fiscal policy, where the use of rigid rules, the constitutionalization of some policies, and reduction in legislative success rates -due to the presence of a more divided and fragmented congress- have limited the adaptability and flexibility of policies. In contrast, in other areas of policy -such as monetary policy and regulation of public utilities- that were formally delegated to the technocracy, policies have been more adaptable to economic shocks, delivering better outcomes.

JEL No. E61, E65, H11

Key words: Political institutions, policymaking, policy outcomes.

¹ We thank Diego López, Miguel Rueda, and Sumie Tamura for excellent research assistance. We are particularly grateful to Ernesto Stein for his thoughtful comments at different stages during this project and to Alberto Alesina, Robert Bates, Mauricio Olivera, Jacint Jordana, Carlos Malamud, Pablo Spiller, Jorge Streb, Mariano Tomassi, and participants at seminars at Harvard University, Fedesarrollo, Universidad de los Andes, LACEA's Political Economy Group, an informal meeting between Colombian lawyers and economists organized by the Ministry of Finance, and the IDB-BBVA workshop, for their valuable comments. We acknowledge funding from Banco de la República and the Inter-American Development Bank.

1. Introduction

In an influential volume edited by Rudiger Dornbusch and Sebastian Edwards on the Macroeconomics of Populism in Latin America, Miguel Urrutia (1991) argued that populist macroeconomics were absent in Colombia, contrary to the norm in the rest of South America. According to the definition used in that volume, one feature of populist economics is the presence of large fiscal deficits, reflecting the use of budget expenditures for redistributive purposes without a concurrent effort to raise tax revenues. As shown in Figure 1, for most of the past century fiscal deficits in Colombia were relatively small (rarely exceeding 4% of GDP) and, when present, rapidly corrected². Moreover, the public sector was relatively small for regional standards (aggregate expenditures and revenues of the consolidated public sector were around 20% of GDP between 1960 and 1990).

Fiscal policy outcomes have changed significantly since the early 1990s. As Figure 1 also shows, there has been a strong deterioration of the fiscal balance. The deficit of the central government has been close to 7% of GDP since the late 1990s, without a clear indication of a major correction. The deterioration of the consolidated public sector (CPS) balance is also apparent. Aggregate public expenditures grew to 33.7% of GDP in 2003 from 21.2% 1990, reflecting a deliberate intention to increase in the size of the state and use fiscal expenditures for redistribution. The fact that total revenues grew to 29.7% of GDP in 2003 from 20.6% in 1990, suggests that the decision to raise government expenditures was accompanied with an effort on the revenue side. However, the effort was insufficient. In fact, the data is unequivocal about the greater tolerance towards fiscal deficits in recent times³. In the words of Carrasquilla (2003, p. 23), “it has not been feasible to consolidate a political agreement that excludes fiscal disequilibrium as an option for public and private agents”⁴.

Until not too long ago, Colombia was regarded as a success story in terms of macroeconomic management. To a large extent, fiscal policy played a stabilizing role, which resulted in low economic volatility (i.e. low variance in GDP growth rates) between 1960 and 1990. The structural deficit in the public sector, has restricted the adoption of countercyclical fiscal policies precisely at the time when external shocks have become more severe. As a result, economic fluctuations have been much larger since 1990. In addition, GDP growth during the 1990s fell to 2.9% per year from a 4.7% annual average between 1950 and 1990. Urban unemployment rates reached 20% in 1999, almost twice the 1978-1990 average. Income concentration has increased since the early 1990s, after decades of falling inequality. In terms of poverty, various measures also suggest a reversal. Conversely, in the case of monetary policy, results show an improvement. After decades of double-digit inflation (see Figure 2), inflation rates have fallen since 1990, reflecting the effectiveness of new political institutions that ruled out high inflation as an outcome.

² Urrutia argued that the particular political development of Colombia had led to clientelism, rather than populism. His hypothesis was that local politicians were not interested in populist macroeconomic policies because the electorate had very low tolerance for inflation so “neither local politicians nor the head of the state are willing to risk the wrath of the public by supporting expansionist fiscal or monetary policies” (p. 379).

³ Ocampo (2004) argues that “the Gaviria (1990-94) and Samper Administrations (1994-98) did not have the explicit purpose of raising the fiscal deficit, but rather to increase the size of the state in an orderly manner,” concluding that recent fiscal policy in Colombia cannot be characterized as populist macroeconomics in the sense of Dornbusch and Edwards (1991).

⁴ The ‘political’ explanations of the fiscal deficit in Colombia have a long tradition among economists. See, for example, Wiesner (2004).

The purpose of this paper is to understand the causes of the change in the quality of policies as well as their outcomes –improvement in some areas and deterioration in others. We focus on fiscal and monetary policies, but the analysis can easily be extended to other areas of policy, such as trade policy and the regulation of public utilities. Rather than analyzing the details, we identify some common characteristics of policies and the policymaking process (PMP) that can be related to changes in the political institutions. More precisely, our goal is to understand how relevant political institutions –such as the constitution- map into political behavior, political behavior into policymaking processes, and policymaking processes into policies and policy outcomes.

It is analytically tempting to focus on the effects of the 1991 constitution, which changed the rules of the political game along multiple dimensions. The new constitution strengthened the checks and balances of the political system, in an effort to endow political institutions with greater legitimacy, after decades of limited participation and low representation. Although remaining extremely powerful even for Latin American standards –only surpassed by the Brazilian executive-, the President lost some capacity as an agenda setter relative to the previous period, while Congress and the Constitutional Court (CC) gained relative power. As a consequence of the larger number of relevant players and the diminished presidential powers, political transaction costs increased in several policy areas. In a nutshell, the tension between representation and cooperation was shifted in favor of the former.

In addition to the changes in the number of key players, as well as in the rules of the political game, the new constitution covered many specific, previously non-constitutional, aspects of policy. This is particularly the case of fiscal policy, where key components of public expenditures, such as pensions, fiscal transfers for education and health, and public sector wages, were hard-wired into the constitution⁵. Many observers have suggested that these embedded rigidities, have been a major source of growing fiscal deficits and public debt, tax uncertainty, and inefficient government expenditures, which are frequently mentioned as the causes of macroeconomic instability and low growth⁶. In an extreme form of rigidity, changes in fiscal policy oftentimes require constitutional reform, which by definition is slow and costly⁷. As a result, fiscal policies are not stable and adaptable to shocks, in sharp contrast to Colombia's own previous experience.

In contrast, monetary and exchange rate policies have been formally delegated to the technocracy since 1991. This has been a result of the constitution –which granted independence to the board of the central bank- and the appointment of technocrats to the board by successive presidents. In addition, the constitution prevented direct monetary financing of specific economic sectors, including the government⁸. As a result, policies have been more stable, coherent and publicly regarded after 1991. Policies have also been partially flexible and adaptable (to external

⁵ According to the IMF (2004), 80% of the budget is predetermined by constitutional or legal mandates, resulting in one of the most rigid budgets in Latin America.

⁶ See for example, the reports of two important technical missions: *Comisión de Racionalización del Gasto y de las Finanzas Públicas* (1997) and *Misión del Ingreso Público* (2003).

⁷ There have been 18 constitutional amendments since 1991. The 1886 constitution was amended 63 times in 105 years.

⁸ Decision to provide loans to the government are not forbidden but require the unanimous vote of all board members, implying that in practice they have not taken place.

shocks), more so after the bank's success in bringing inflation down (initially flexibility was sacrificed in order to gain credibility).

It is also interesting to discuss whether larger fiscal deficits have been the result of changes in monetary policy. Here, the evidence provided by Villar (2004) suggests that although Central Bank independence has reduced potential fiscal seignorage (i.e. the share of seignorage that benefits directly the government), the historical fact is that fiscal seignorage was never high in Colombia, except during the early 1980's. Therefore, central bank independence and the reduction in seignorage revenues do not explain the growing fiscal imbalances since the mid nineties.

To develop the argument, the paper proceeds in the following way. In section 2 we familiarize the reader with some historical background about Colombia. Section 3 presents the conceptual framework and defines those features of policies that are the dependent variable of our analysis. Section 4 describes the key political actors in Colombia: president, congress, political parties, and the CC. The idea is to show how the relative powers of the different players have evolved throughout time. Section 5 discusses the policymaking process in Colombia, with special emphasis on those aspects that changed after the 1991 constitution. Section 6 presents the empirical exercises, using a database containing 3,428 law initiatives discussed in congress during the last 20 years. The main point of the exercise is to document the relative reduction in presidential powers, measured by the increased difficulty of the executive in enacting laws in congress. More importantly, the evidence suggests that the fragmentation of congress (more lists and more parties) explains the greater difficulty in passing laws. Sections 7 and 8 discuss in more detail the salient features or outer characteristics of fiscal and monetary policies, respectively, and illustrate the policymaking processes in both cases. The paper ends in section 9 with a summary of the main findings and some preliminary remarks on the policy implications of two recent institutional changes –the possibility of presidential reelection and the reform to the electoral rules–.

2. Historical background

In 1958, after ten years of political violence between the two traditional parties (*Liberal* and *Conservador*), and four years of a military government (1953-1957), the traditional parties' leaders agreed to share power during four presidential terms, between 1958 and 1974⁹. In addition to alternation in the party affiliation of presidents, the agreement (initially a referendum and later a constitutional amendment) included a strict 'parity' between the two parties in the key policymaking arenas, such as congress, cabinet positions, courts, governors and majors. Many features of this agreement survived after the 'formal' end of the *Frente Nacional* in 1974.

In spite of their apparent success in terms of economic policy outcomes, the political institutions and the consequent rules of the political game derived from the *Frente Nacional*

⁹ The agreement's goal was to bring an end to partisan confrontation which had resulted in a large number of violent deaths in the period 1948-1958. As discussed in Chacón (2004) the exact figure is a highly contested issue.

agreement were unsustainable¹⁰. The agreement between liberals and conservatives excluded other sectors, most relevantly the left, which did not have access to a democratic channel to participate in the political process. Guerrilla activity became more intense and the political system started to lose credibility due to patronage, corruption, and the entry of drug money into the political scene¹¹. The exclusionary nature of the system plus the lack of authority and presence of the State in parts of the country deteriorated the *Frente Nacional's* popular support, resulting in high rates of abstention. Guerrilla groups -such as the M19, EPL, ELN and FARC- as well as labor and social movements gained momentum in urban and rural areas.

Colombia's level of violence escalated during the 1980's, precisely when drug trafficking activities grew exponentially. According to Rocha (1999), between 1981 and 1990, the production of cocaine increased by 672% (from 52 to 398 tons). However, data from the UNODC (2004) indicates that the production of cocaine in 1990 was 92 tons and that it rose to 695 tons in 2000, and then fell to 440 tons in 2003. Regardless of the source, there is clear indication of the rapid increase in drug trafficking activities between 1980 and 2000. In relation to the homicide rate, as shown in Figure 3, it is interesting to note that this variable reach a peak in 1991 (89 homicides per 100,000 inhabitants), precisely when the new constitution was enacted. Since then, the homicide rate has been falling, although other crime indicators do not show the same trend¹².

During the 1980s and early 1990s the Medellin and Cali drug cartels were very strong in terms of resources, controlling much of the illicit drug business, with growing political influence both regionally and nationally. The cartel's private armies, which later evolved into paramilitary (the so-called self-defense) groups, protected them from internal fights, extradition, and kidnapping from the guerrilla. Eventually the drug lords were captured and the large cartels dismantled. However, the success of this strategy opened the door to the guerrilla and paramilitary groups to break into the business at a larger scale. It is a well established fact that these groups derive an important amount of income from the drug business.

President Belisario Betancur (1982-1986) proposed a political rather than military solution to the guerrilla problem. In 1984, that government signed a truce agreement with the FARC and started the negotiations with M19, the two largest guerrilla groups at the time. These efforts failed, and the confrontation escalated to a higher level (the Palace of Justice was taken in 1985 by the M19, resulting in the tragic death of the majority of the justices of the Supreme Court). In spite of the failure of the peace talks, the left created a new political party (*Unión Patriótica*) with strong links to the FARC with very limited electoral success. The experiment ended abruptly because many of its members were killed by paramilitary groups. In 1989, during the Barco Administration, the M19 (and other smaller insurgent groups) finally gave up the arms and entered the political contend with some success.

¹⁰ In the terminology of Aghion et al. (2004), during the *Frente Nacional* the traditional parties were almost sure to rule so a high level of insulation of the executive was functional. This led to economic stability, at the cost of political unrest, in a way that is reminiscent of the autocratic regimes in other countries in Latin America.

¹¹ Incidentally, the emergence of drug-trafficking made local politicians became more independent from the party bosses in Bogotá, which gradually lost control over the conformation of party lists.

¹² See Levitt and Rubio (forthcoming 2005) and Cárdenas (2002) on the causes and consequences of crime in Colombia.

The response of the FARC was to escalate the confrontation with the drug cartels for the control of the drug business, increase the revenues derived from kidnappings and extortion (a strategy shared with the ELN) and establish strongholds in areas rich in natural resources but with relatively low State presence, from which they could derive rents. This was particularly the case of the regions where major oil discoveries took place during the 1980s (oil reserves were 6 times larger in 1990 than in 1980). Adopting similar strategies, the paramilitaries became increasingly independent from the drug cartels. As a result, the government decided to increase defense and security outlays, which explains part of the increase in public expenditures during the last two decades.

The assassination of three presidential candidates of the in 1989 including Luis Carlos Galán -the likely winner- elicited a popular demand for political reform¹³. The long debated idea of a constitutional reform gained popular support as a response to the political unrest, at a time when great importance was given to the successful incorporation of guerilla groups –especially the M19- into the political system¹⁴. Ultimately, it was the students’ initiative through the *movimiento séptima papeleta* that succeeded in this effort¹⁵. Dugas (2001) describes the process,

‘In the final tally, the students estimated that approximately two million Colombians had cast extra-legal ballots in favor of summoning a National Constituent Assembly. Although the seventh ballot had no legal standing it served as a striking indicator of public discontent with the existing political regime. In the aftermath of the March (1990) elections the proposal to establish a National Constituent Assembly gained momentum as all four major presidential candidates declared their support for this extra-constitutional mechanism.’ (p. 382)

President Virgilio Barco in recognition of people’s will, issued decree 927 of 1990 to authorize the introduction of a ballot in the May presidential elections which called for a Constitutional Assembly to reform the national constitution. The Supreme Court declared constitutionality of the decree by admitting, at the same time, the incapacity to confront the different types of violence facing the nation (Lleras and Tangarife, 1996). The ballot, which became an official plebiscite, resulted in more than 5 million votes in favor of the National Constituent Assembly. President-elect Gaviria called for elections in December to organize the Constituent Assembly. The new Constitution was adopted on July 4, 1991.

3. Conceptual framework

As mentioned in the introduction, the goal of this paper is to establish a link between the observed changes in policy outcomes and the changes in political institutions. Following the

¹³ The candidates were Bernardo Jaramillo (UP), Carlos Pizarro (AD-M19) and Luis Carlos Galán (a previous dissident of the official liberal party and then competing for the party nomination).

¹⁴ The proposals for political reform during the administrations of López and Turbay did not prosper. The most important one was Lopez’s Constitutional Assembly. Later, several bills were presented to congress, without success, with the goal of institutionalizing political parties, providing guarantees to parties in the opposition, and improving the electoral system. See Hartlyn (1993).

¹⁵ This refers to the fact that the student movement asked the electoral authorities to introduce a seventh ballot in the elections of March 1990 (the other six ballots were for the election of the Senate, House, governors, departmental assemblies, majors, and city councils). The ballot in support of the constitutional reform was unofficial, in the sense that it had to be counted by the students and did not have legal implications.

framework developed in Spiller, Stein and Tommasi (2003), Scartascini and Olivera (2003) and Spiller and Tommasi (2003), our task is not to analyze the details of specific policy areas. Rather than focusing on the policy outcomes directly, we want to identify those features or characteristics that tell us whether policies are optimal in the sense of being invariant to political shocks but flexible to adjust to economic shocks.

In other words, we do not try to explain the content or substance of policies (such as whether the currency is overvalued or not), but rather certain common features or qualities of public policies, termed as *outer features*, that are systematically present in those policies¹⁶. These features refer to aspects such as the *stability/volatility* of policies. We consider that stable policies are those that can be sustained beyond the tenure of a particular government, whereas volatile policies show reversals associated with political events such as elections or cabinet reshufflings. Another related and useful dimension for the characterization of policies is their *adaptability/rigidity*. This refers to the fact that sometimes political actors try to prevent future policy reversals by embedding policies with rigidities. This is problematic, since policy adjustments are sometimes desirable, in the sense of being welfare improving. The degree of *coordination or coherence* among different political actors (e.g., different levels of government) is another interesting dimension that reflects the nature of the political game. The extent to which policies resemble public goods and promote the general welfare (in contrast to policies that produce mostly private benefits) is another relevant distinction¹⁷.

The general idea of the framework is that the ability to reach cooperative outcomes among the key political players affects the outer features of public policies. The key point here is that the specific political institutions –together with some particular aspects of the policies– determine whether cooperative intertemporal transactions are possible or not. When these transactions are feasible, public policies are more effective, more sustainable, and more adaptable. In contrast, when intertemporal political agreements are harder to strike and enforce, policies are either too unstable (in the sense of being subject to political swings) or too rigid (in the sense that players inefficiently tie their hands, rather than leaving some political discretion). As in oligopoly games, fewer political actors and lower immediate benefits from deviating are two key factors that facilitate cooperation¹⁸.

This framework encompasses other approaches that are useful for our analysis of political institutions and policy outcomes. Tsebelis (2002), for example, focuses on the number, ideological differences, and internal level of cohesion of “veto players”. Cox and McCubbins

¹⁶ This choice is useful because the common features of policies are more naturally linked to the institutional environment than the content of policies. In addition, the focus on outer features also allows comparability across policy issues, which would not be possible with the contents of policies.

¹⁷ Weaver and Rockman (1993) list ten key “government capabilities” that are close to our outer features: (i) To set and maintain priorities among the many conflicting demands made upon them so that they are not overwhelmed and bankrupt; (ii) To target resources where they are most effective; (iii) To innovate when old policies have failed; (iv) To coordinate conflicting objectives into a coherent whole; (v) To be able to impose losses on powerful groups; (vi) To represent diffuse, unorganized interests in addition to concentrated, well-organized ones; (vii) To ensure effective implementation of government policies once they have been decided upon; (viii) To ensure policy stability so that policies have time to work; (ix) To make and maintain international commitments in the realms of trade and national defense to ensure their long-term well-being; and (x) To manage political cleavages in order to ensure that the society does not degenerate into civil war.

¹⁸ To add some notation, the outer features are the dependent variable (Y) of the analysis. These features are the outcome of intertemporal political transactions among political actors, which in turn are conditioned by the rules of the political game, embodied in the political institutions (X). The specific political institutions depend on constitutional and historical determinants (W), which should not be considered as exogenous to the analysis. Each policy area also has its own specificities (Z), such as their time horizons, observability, irreversibility, etc. In sum, this approach maps the interaction of X(W) and Z into Y. It should be noted that Y, ultimately, has an impact on W.

(2001) underscore the trade-off between the ability to change policy (“decisiveness”) and the ability to commit to enacted policies (“resoluteness”). The larger the number of veto players, the closer policies would be to resoluteness rather than decisiveness. Cox and McCubbins (2001) provide another dimension to the analysis, relevant for Colombia, by distinguishing between the “separation of powers” (number of institutional veto points) from the “separation of purpose” (which refers to the diversity of interests of those controlling the veto points). This is the case, for example, when local politicians do not worry about national problems, in spite of the fact that they can act as veto points on national issues.

4. Key political actors in the policymaking processes

The entire set of characteristics of the PMPs, including the role of key and veto players, the policy initiation process and the effective number of parties, had important modifications during the late 1980s and early 1990s. This is mostly related to the end of the rules imposed by the *Frente Nacional* and the emergence of new political institutions. Since the drafting of new constitution in 1991 is the most salient of these transformations, it is convenient to characterize key political actors and the corresponding PMPs before and after that year. However, two caveats are in order. First, some of the changes in the underlying political institutions preceded the 1991 constitution, such as the initial steps of the decentralization process, including the direct election of majors (1986). Second, the transformation was not restricted to the constitution. Other factors, such as market-oriented reforms introduced in the early 1990s or the greater interest of the U.S. in Colombia in recent years, have had an impact on PMPs.

In order to characterize the PMPs it is necessary to determine which are the key actors that participate in it? What powers and roles do these actors have? What preferences, incentives, and capabilities do they bring to the table? And, what is the nature and frequency of their interactions?

4.1 President

As it has been the case in most Latin American presidential regimes, an important number of constitutional prerogatives make the Colombian president the main agenda setter in most policy areas. This is true even after the 1991 constitution, which reduced presidential powers in a number of dimensions. Table 1 compares constitutional presidential powers before and after the 1991 constitution.

Proactive powers

The 1886 constitution established a highly centralized power structure. The president controlled the budget and was constitutionally granted extraordinary legislative powers when invoking the “state of siege”. Even though the 1914, 1936 and 1945 constitutional amendments tried to diminish presidential powers, the 1968 constitutional reform promoted by president Lleras-Restrepo elevated them to a new level. In addition to strengthening the legislative initiation capacity of the president, the reform significantly increased executive’s control over the

budget. The president could exclusively introduce legislation in key areas, issue decree-laws when in crisis, and issue administrative decrees with limited judicial review.

The 1991 constitution deliberately curbed the legislative powers of the president by limiting to 90 days the declaration of either a state of internal commotion, or a state of economic emergency, which can be extended for another 90 days if considered necessary for the state of internal commotion, and 30 days extended to a maximum of 90 days for the state of economic emergency. A third extension, however, requires previous consent from the Senate. The CC may revoke decrees issued –including the declaration of the emergency or commotion- if considered unconstitutional in any way. Before, decrees issued under state of siege became laws, even after the special status had expired. After 1991, decrees only remain in force if congress enacts them in regular sessions. In addition, now the pro-tempore powers cannot be used to decree codes, statutes, organic law or taxes (see Archer and Shugart, 1997, p.123).

The presence of the CC has restrained the use of the president's special powers. Prior to 1991, the president only required the signatures of all his cabinet to use extraordinary powers to issue decree-laws in a 90-day time frame. Although the subject matter was supposedly narrow, in practice the president could use the emergency powers to make policy with freedom. The Supreme Court was the only veto gate as it had the duty to review each of the decrees enacted, but it was not as active and independent as the current CC. The judicial budget was determined by the executive, and the Supreme Court was elected from lists handed by the president to the House of Representatives and the Senate. A critical aspect was that magistrates had short terms (5 years), with the possibility of reelection. As we will discuss in detail below, now the CC is elected by the Senate for longer terms (8 years without reelection), with only one third of the lists submitted to the Senate originating in the executive.

One important aspect in which there has been no change is the president's permanent control over the legislative agenda by using the discharge or urgency petition. This petition enables the president to prioritize a bill in the legislators' agenda. Congress then has 30 days to debate and pass or reject the bill. The president can also ask for joint sessions of house and senate committees in charge of the law in order to speed up the process, by limiting debates to two instead of the regular four¹⁹. Also, the executive kept the exclusive right to introduce bills concerning the structure of the ministries, salaries of public employees, foreign exchange, budget, external trade and tariffs, national debt, among others.

Integrative powers

Prior to 1991, the president had greater appointment powers (governors, justices, and heads of control entities, among others). The president also appointed the governor of the central bank. The president lost the power to appoint majors in 1986, and governors in 1991, which in practice ended the dominant role over the career paths of regional political leaders²⁰.

¹⁹ Before 1945 there were six mandatory debates.

²⁰ Since 1986, municipalities (currently 1069) elect their majors and (since 1991) departments (now 33) elect their governors for single three year terms (extended to four years after 2003). Previously, the president had the right to appoint and dismiss all governors and majors. Political decentralization as well as fiscal decentralization has increased the influence of majors and governors, although not the point observed in

Incidentally, mayors and governors operate more as agents of legislators, rather than the opposite which is the case of countries like Argentina and Brazil. There are, of course, important exceptions, like the mayor of Bogotá or the governor of Antioquia, the largest department.

This means that the president lost a bargaining chip to negotiate with both national and regional leaders. Also, presidential reelection was permanently banned by the 1991 constitution (prior to 1991 presidents could run again although not for consecutive terms). However, at the end of 2004 congress approved a constitutional reform allowing presidents to be reelected for consecutive terms.

Reactive powers

The president can veto legislation, on procedural and substantive grounds. However, congress can override the executive's veto with a ½ majority. Before 1991, it was much harder to overrule a presidential veto because a 2/3 majority was required.

Electoral rules

Finally, a majority runoff electoral rule replaced the plurality rule²¹. The majority runoff along with the timing of congressional elections –which take place before the first round presidential election-, have changed the patterns of coalition building. After 1991, we observe a clear pattern of post-electoral coalitions, especially in Samper and Pastrana's term, and a greater role of congressman in the election of the president, especially due to the closeness of these elections. President Uribe Vélez, running in 2002 on an independent platform was the first candidate to obtain more than 50% of the votes in the first round in the three presidential elections since the introduction of the second round. The average share of the vote obtained in the first round in the 1994 and 1998 presidential elections was 40.39%, in contrast to 51.01% in the 1978, 1982, 1986, and 1990 elections.

4.2 Congress

The Colombian congress can be classified as reactive more than proactive, given the large legislative powers of the executive and its lack of organization and resources²². A powerful executive combined with an extremely personalistic electoral system, implicitly delegates the national agenda to the president and the cabinet members. Notwithstanding, the legislature has always been an important veto player for the president, especially in areas where the executive does not have complete jurisdiction. The symmetric two-chamber Colombian congress is one of the oldest in Latin America. Changes have affected size, constituencies, and tenure. One of such reforms was the introduction of directly elected senators in 1930 (previously indirectly elected by

Argentina and Brazil. Governors and mayors (with few notable exemptions) do not play a key role in national politics. They are highly dependent on the national budget, especially for public investment funds.

²¹ Payne et al. (2003, p. 86) argue that the abandonment of the plurality formula was motivated by partisan power strategies, such as preventing a third, minority party from obtaining the presidency. Others argue that this was a strategy of the Conservative party to take advantage from the factionalism of the Liberal party.

²² See Payne (1968, p. 246) for a crude description of the lack of resources of the Colombian congress.

departmental assemblies)²³. Members of the senate were more prominent leaders in congress, mainly because they had four year terms, compared to two year terms for members of the House (extended to four years by the 1968 reform).

The 1991 reform reduced the number of representatives to 165 (from 199), and the number of senators to 102 from 113²⁴. Also, the reform transformed the national territories (large portions of the territory with low population density) into *departamentos* and established a minimum representation of two House members per *departamento*. Thus, seven of them achieved representation in the House for the first time. Since 1991, senators are elected in national, rather than departmental, constituencies.

Electoral rules

As shown in Figure 4, congressional elections have become increasingly contested, especially after 1991. The rapid growth in the number of lists competing in congressional elections has also implied that a large number of successful lists elect only one legislator (Figure 5). For example, in 2002 only 3 lists, out of more than 300, rendered more than one senator. To a large extent this has been the result of the electoral rules that have been used during the last 40 years, which were not changed by the 1991 constitution. In fact, according to the formula of largest-remainders (LR) or Hare system, seat quotas are calculated by dividing the number of votes by the number of seats. Seats are first allocated to lists which surpass the quota. The remaining seats are then allocated to the largest remainders, generating incentives for parties to fragment into factions. To illustrate the point, take the case of a district with 1000 voters and 10 seats, so the quota is 100. Party A has 650 votes, B has 240, C has 70 and D has 40. Accordingly, party A would get 7 seats (6 by quota, 1 by remainder), B would get 2 (by quota), C would get 1 (by remainder), and D none. Now, if B subdivides into 3 factions it will get 3 seats (all by remainder) taking one away from party A, who gets 6. Party C does not benefit from fragmenting, however, showing that this strategy is only beneficial for parties that are large enough to get at least one seat allocated by quota (in fact, if C splits into two equal parts, it gets nothing). Now, if party A splits in 8 factions, and party B in 3, they will capture all seats (8 and 2, respectively).

The key point, as mentioned by Payne et al. (2003), is that the largest remainder formula is applied in each district to factional lists rather than party lists. The electoral law allows multiple factions to present lists under the same party label. Thus, though the factional lists are closed and blocked, in effect the system can be considered to operate with unblocked party lists. The result is that parties have increased the number of lists over time, maximizing their seat share, while enhancing its decentralization and factionalization²⁵.

²³ Previously, legislators were not remunerated and the system of specialized committees had not been adopted. In 1945, the two chambers adopted common rules of procedure. That year, the number of readings for the bills was reduced from six to four, enhancing the role of specialized committees (see Pachón Buitrago, 2004).

²⁴ Currently the house has 165 members, including 4 from special districts (two from indigenous communities, two from black communities and one from Colombians living abroad). The Senate has 102 members, two of them elected from the special indigenous districts.

²⁵ See Roland and Zapata (forthcoming 2005) for the implications of the electoral rules.

As a result, most seats are allocated by the residual system. In 1998, only 5% of senators were elected by quota, all the others by remainder. The marginal price of a seat, calculated as the minimum remainder for which a seat was allocated represents roughly only 40% of the number of votes specified by the quota and was lower in 1998 compared to 1991 and 1994. As a result, some elected senators represent less than 0.1% of Colombia's population²⁶. The 1991 reform did not change this situation, mainly because no representation thresholds were put in place to discourage small lists. The LR-Hare system remained in place encouraging fragmentation and election by largest remainders²⁷.

Instead of achieving what Haggard and Mc Cubbins call “unity of purpose” by having more urban representation and dispersed constituencies, the national constituency for the Senate furthered the political fragmentation. Rather than gathering votes across districts as initially intended by the reform, seats are gained mostly by getting regionally concentrated votes. Thus, senators are still inclined to policies that produce regional or sector-specific benefits, making it hard for the government to push policies that resemble public goods. Furthermore, as discussed below, State campaign funding is given directly to the candidates, creating additional incentives to form factions or movements, instead of depending on the “national party” resources.

The combination of the incentives created by the electoral system and the campaign funding has resulted in a large number of movements that are essentially electoral machines. For example, 72 movements obtained at least one seat in the House of Representatives in the 2002 election²⁸. Although these movements are typically affiliated with major party, the excessive fragmentation of legislators is a key characteristic of congress, with important impact on the policymaking process.

Organization

Each chamber is organized in seven (eight before the 1991 reform) *Comisiones* which have a significant role in the workings of congress (see Table 2). Since 1945, legislators can only belong to one permanent committee and have to stay in that committee during their entire four year term. Committee's membership is determined by elections. Each legislator has one vote and needs a certain number of votes in order to get into a particular committee. Committees dealing with constitutional and economic-budgetary matters, require more votes than the rest. To facilitate coordination, each party names a *compromisario* (delegate) in order to postulate legislators of that party to the different committees, taking into account seniority, specialty, and popularity of the legislator. Party membership is indispensable in order to access the committee of first preference (Pachón-Buitrago, 2003). This is important because it shows that behind a veil of fragmentation and atomization, party structures play a role in order to organize legislative activity. We will see more evidence in this direction in the discussion of political parties below.

²⁶ See Botero (1998) and Rodriguez-Raga (2001).

²⁷ In a way, this system is diametrically opposite to that of Chile, where if coalitions do not come together, they do not reach the 1/3 threshold, and they do not win any seats.

²⁸ The only requirement to form a political party is to present 50,000 valid signatures. As a result, most legislators form their own ‘movement’, appearing on the ballot with a different party label than the traditional party to which they belong. This data can be found in <http://www.cne.gov.co/partidos/vigentes.htm>

Exclusive committee membership contrasts with other Latin American congresses where legislators belong to various permanent committees and, hence, do not have the incentive to specialize. The Colombian congress also has a small number of standing committees, which are entrenched in the Constitution, compared to the Mexican or Argentinean legislatures which have more than 35 standing committees with overlapping jurisdictions. This means that the rules of the game are stable since there is only one route for the introduction of legislation. The only choice in the hands of the executive is the starting point, which can be the house or the senate. Plenary sessions rely heavily on what is approved by the Committees, especially in economic and budget matters. Membership to the Economic and Budget Committees is highly valued, because of the proximity to government funds. The Committee in charge of constitutional and political affairs is also highly visible, and membership a greatly disputed issue.

As a consequence of growing professionalization, incumbency rates have been steadily higher since the 1930s. As shown in Figure 6, the incumbency rate has increased to 50% in the last decade, from 10% in 1935. Nonetheless, and possibly as a result of greater fragmentation, incumbency rates have fallen both in the house and senate after the 1991 constitutional reform. Still, when compared to other Latin American countries, Colombia has one of the highest incumbency rates²⁹.

Certainly, there are members of Congress which have a long tenure, and are considered to be “professional legislators”, characterized by what has come to be known in the literature as “static” ambition (Samuels, 2003). However, the “amateur legislators” with “progressive” ambition is not foreign to the Colombian congress, where legislators do not run for reelection or simply opt for other political offices. We argue that certain committees (e.g. constitutional, economic, and budgetary) offer legislators an incumbency advantage as well as a differentiated level of professionalization, in comparison to other committees. As a result, members of those committees are the natural leaders of congress. Using data from 1970 until 1998, Figures 7 and 8 show that the incumbency rates for members of these committees are higher than for the rest of legislators. Professionalization seems to provide an advantage to incumbents.

4.3 Political Parties

The Colombian party system dates from the early years of the republic, and is considered one of the oldest and most institutionalized in Latin America (Mainwaring and Scully, 1995). The system has been dominated by two strong parties -Liberal and Conservative-. High polarization between them oftentimes resulted in conflict and violence. The last of such episodes -and one the worst- ended with the *Frente Nacional* pact in 1958 which, as mentioned above, established a strict parity between the two parties.

Even before the *Frente Nacional*, the party system was characterized by high intra-party competition, functional party coalitions in congress, and significant party discipline in presidential elections. Although intra-party competition was always part of Colombia’s political

²⁹ According to Pachón (2004), the reelection rates of Argentina and Brazil are 17% and 45%, respectively.

history, lack of vote-pooling since 1974³⁰, political decentralization since the early 1980s, as well as the 1991 constitutional reform brought it to new levels.³¹ In the last fifteen years, small parties and movements have proliferated.³² The existence of high intra-party competition weakened political leadership, ultimately fragmenting party organizations and undermining the traditional two-party system.³³ Although there are still no conclusive answers about the effects of decentralization on the party structure, one of the most discussed effects has been the fragmentation of the party system (Pizarro 1995, Shugart 1997, 1999, 2004; Rodriguez-Raga 1999, 2001). The degree of fragmentation has increased largely because regional and local political machines do not require centralized political parties. The party no longer has means to control career paths of its party leaders in the local areas.

To make politics even more candidate-based, the 1991 constitution incorporated a system of direct public funding for congressional and presidential campaigns, where the political movement rather than the party is the recipient of the funds. At the same time, the constitution confirmed the independent electoral authority (*Consejo Nacional Electoral*), in charge of elaborating and distributing the ballot (*tarjetón*) with the name and picture of all aspiring candidates. Before 1986, candidates were responsible for handing out their lists in pieces of paper (called *papeletas*) that were used to cast a vote. Party infrastructure was useful for the distribution of *papeletas* among voters. Currently, there is less value to those logistic capabilities. These reforms not only allowed new cleavages to run for elections, but lowered the costs of leaving traditional parties and their central directorates.³⁴ This, of course, has to be analyzed in conjunction with the increased availability of public expenditures at the local level as a result of fiscal decentralization. Legislators are increasingly independent from the parties and from the national government.

However, as mentioned above, internal rules of congress enhance the role of the parties and re-centralize power in a few hands. Parties are determinant for accession to specific Committee membership, hierarchical positions (presidents and vice-presidents of the senate, house, and their respective committees), and strategic roles (sponsor of key bills). The president of the committee appoints one or several sponsors for each bill. Sponsors, in turn, have a decisive role in the legislative process. On key bills initiated by the executive, sponsors have large bargaining power. They are very influential in what is finally approved in the floor and act as political brokers between the executive and other legislators. The relative position in this hierarchy (president of the chamber, president of the committee, and sponsor) determines the amount of pork that a legislator receives, in the form of positions in the national government bureaucracy and funds for investment projects³⁵. As shown in Figure 9, the number of sponsors

³⁰ Before 1974, parties pooled votes across lists within the parties. If a list had less than half the electoral quotient, the votes from this list would be transferred to the list with most votes. See Pachón (2004) on the consequences of the lack of vote pooling in Colombia since 1974.

³¹ On decentralization and fragmentation of the party system see, among others, Pizarro (1995), Archer and Shugart (1997), Nielson and Shugart (1999), Fajardo, Moreno and Shugart (2004), Rodriguez-Raga (1999 and 2001) and Gutiérrez (2003).

³² Gutiérrez (2003) suggests that the proliferation of lists is controlled by the party.

³³ Gutiérrez (1999 and 2001) argue that the internal structures of the traditional parties have changed but have not been destroyed. The value of the party label is still an important asset for politicians, although the linkage among the different levels of government has a more horizontal character where it is difficult to impose sanctions.

³⁴ In 1998, 67 parties and movements were legally recognized by the electoral authorities receiving state funds. See Posada-Carbó (2001).

³⁵ Unfortunately there is no data to support this point, but euphemistically legislators speak of platinum, gold, silver and regular status depending on where they rank.

per bill has been increasing rapidly since 1991. As we will show below, a bill with more sponsors has greater chances of success³⁶.

These privileges are distributed with partisan criteria, and thus, legislators organize procedural coalitions in order to secure them (see Carroll, Cox and Pachón, 2004). As a result, post-electoral party coalitions are the norm rather than the exception. A good example is the organization of the independents into the *Polo Democrático*. Before 1998, independents constituted 25% of the congressional seats, but had no representation in any valuable position in congress. After forming a coalition for the 2002 elections they have been able to secure strategic positions. Thus, although the structure of parties in congress can be described as horizontal, the internal rules of congress provide a temporal hierarchical structure that also improves their bargaining power vis-à-vis the executive.³⁷ In other words, parties solve the collective action problems within congress.

Finally, Figure 10 shows the Laakso-Taagepera index of Effective Number of Parties (ENPP), which is a measure of fragmentation, calculated as the inverse of the sum of squared party shares for each legislative election³⁸. The ENPP has increased from two political parties in the 1970s (liberal and conservative), to three in the post-1991 period (liberals, conservatives, and the AD-M19), to four in 2002: liberals (official), liberals (uribistas), conservatives, and the *Polo Democrático* center-left coalition which includes the AD-M19.

4.4 Courts

In the Colombian system of separation of powers, the judiciary has always been a key player in the policy-making process. Since the 1886 Constitution, the Supreme Court was in charge of constitutional revision and dispute settlement between the executive and congress (for instance after a presidential veto on the grounds of unconstitutionality). The Supreme Court also revised ex-officio all decrees issued by the executive during a state of siege or state of economic emergency. According to Cepeda (forthcoming 2005) between 1886 and 1991, of a total of 2496 rulings of constitutional review, 1489 (that is 60%) were related to decrees issued under periods of exceptional legislative power of the executive. Of the latter, only 25% were found unconstitutional. Due to the constant use of extraordinary powers by the executive, the Supreme

³⁶ An interesting trend is seen when the government calls the joint economic committees (house and senate) to discuss a bill in which the executive has special interest. In this case the probability of success is much higher (on average 75% of the bills are approved). The cost, however, is explosion in the number of sponsors. The only bill submitted to the joint economic committees in 2003 had 36 sponsors.

³⁷ There was a constitutional reform in 2003 in which Congress approved the change of the electoral system, changing the Hare quota to the DHondt quota, as well as an open list system for all councils, assemblies and the national congress. The first election with the new system will take place in 2006 at the national level. At the regional level, the first election took place in 2003. For an explanation for the reform, see Fajardo, Moreno and Shugart (2004).

³⁸ $ENPP = (\sum s_i^2)^{-1}$, where s_i is the seat share of party i in the legislature. We calculated it by adding movements because the traditional parties endorse these movements, and count them as party members. For example, Senator Roberto Gerlein who has been a conservative leader in congress for decades runs under the label *Movimiento Nacional* and not with the one of the Partido Nacional Conservador. The same happens with Senator Jose Raúl Rueda, who is also a conservative, runs on the label *Movimiento Político Ciudadanos por Boyacá*. However, they vote together and are part of the conservative coalition for procedural elections within Congress. The same happens with the independents that run under different movement labels but behave as a coalition once in Congress (M-19, *Movimiento Visionario*, ANAPO, etc.) Currently, there exist more than 70 party labels that are recognized by the Registraduría Nacional del Estado Civil. Thus, it makes more sense to count them together even if they run on apparently different party labels. The information about these coalitions for the Conservative Party is in Pachón (2002), and in the reports done by *Congreso Visible* at www.cvisible.uniandes.edu.co.

Court became the last instance for very contested and difficult decisions. One of the most remembered is the ruling that declared the unconstitutionality of the Extradition Treaty in 1986, after drug-traffickers threatened justices³⁹. Before 1991, although the Supreme Court was active in terms of judicial review (probably more than other Latin American courts), with some important and notable exceptions its rulings focused more on formal review of the procedures and less on the content of the bills⁴⁰. Without doubt, the appointment mechanism, as well as the strict bipartisan parity restricted the independence of the judicial defense of the constitution.

After the major reforms of 1991, the key player became the CC. The nomination procedure changed radically, as part of an explicit attempt to make the judiciary more independent from the government. Nine magistrates are elected by the Senate from lists presented by the president, Supreme Court, and Consejo de Estado, for periods of eight years, without the possibility of reelection⁴¹. From an abstract *a posteriori* review of the law, the new system is based on abstract *ex officio* and *ex ante* review of the most important statutes, treaties and bills. In addition, the CC revises *ex-officio* the declaration of any state of emergency by the executive as well as the decrees issued under such status. Although *ex post* judicial review had been in the judicial system since 1904, the amount of bills that are reviewed each year has increased monumentally in the last ten years. In fact, since 1991 the CC has issued 2923 rulings on abstract constitutional review, more than the Supreme in Court in 104 years. The majority of these rulings result from the citizen's use of the *Acción Pública de Inconstitucionalidad*. In 27% of the cases the CC has ruled the reviewed laws or decrees (or aspects of them) unconstitutional. Between 1992 and 2002, a total of 141 rulings corresponded to the constitutional revision of decisions taken by the executive under special legislative power. The relative small number (less than 5% of the total rulings on constitutional review) is indicative of the restrictions imposed by the constitution on the use of these powers by the executive. Moreover, 35% of the legislative decrees were found unconstitutional while in another 4% the constitutionality was conditioned by the CC.

Although in theory the CC is expected to have negative legislative power, in practice it exercises great influence over policymaking. The main reason is that the many policy issues have been elevated to the constitutional rank, especially after the constitutional revision of laws. This has been the case of public sector wages, mortgage interest rates, and pensions, among others. In practice, this implies that constitutional reforms are necessary to change policies in certain areas, and even then reforms are subject to the constitutional revision. A good example is the 2003 referendum that was required in order to freeze government salaries. Given the legislative procedure that a constitutional reform entails, transactions costs are now higher and the CC has a larger jurisdiction.

³⁹ See Arrieta (1991).

⁴⁰ See Sarmiento (1985) and Cepeda (2005) for an account of some interesting exceptions where the Supreme Court opposed the government on important matters such as constitutional reform, tax initiatives, and extradition.

⁴¹ Rosenthal and Kugler (forthcoming 2005) provide a detailed account of the workings of the judiciary branch.

4.5 Technocracy

Long before John Williamson in his writings on the Washington Consensus coined the term “technopols” to describe the key role played by US/UK graduate trained economists in the policy-making process in Latin America, in Colombia, since the early 1960’s, “technocrats” was the term used for this new breed of bureaucrats.

Technocrats made their first appearance in Colombia as a result of the creation of the Monetary Board in 1963 and the powerful National Planning Department, which became the landing place for the newly graduated foreign trained economists. With rare exceptions, the head of the Planning Department (a cabinet level position) has been a Ph.D. economist with recognition in academic circles. The role of the technocracy as a key player in the PMP scene was strengthened under the Lleras Administration in 1966-1970. The President made wide use of the CONPES (Consejo de Política Económica y Social) as a vehicle to formulate policies, based on documents prepared by the Planning Department. Moreover, the implementation of those policies was often delegated to the technocrats, above the mandate of cabinet members.

The role of the technocracy achieved a high point during the López Administration (1974-1978). Not only the powers of the Monetary Board advisors and the Planning Department were enhanced, but for the first time, a foreign trained economist was appointed as Finance Minister. All significant posts at the ministry were assigned to technocrats (some of them becoming Ministers of Finance years later). More importantly, the leadership in the economic PMP was transferred completely to the Finance Minister, and, notwithstanding some exceptional periods, it has become a norm that Finance Ministers are chosen among professionally trained economists, most of them with graduate training in top foreign universities.

Another high point in delegation of policy-making powers to technocrats was reached during the administration of Cesar Gaviria (himself a professional economist and former Finance Minister). The major step in this direction was the delegation of monetary policy to an independent board, which has become a stronghold of the technocracy. Besides this decision, it does not seem that there has been any enhancement in the role of technocrats in the PMP resulting from the 1991 constitutional.

Although technocrats have, on occasions, been appointed to other ministries their influence has been much less important than in the economic policy arena. The career path of technocrats often involves academic work at independent institutions such as FEDESARROLLO and the Universidad de los Andes, or international organizations. Very few have embarked on successful political careers.

5. A characterization of the policymaking processes (PMPs)

5.1 Before the 1991 Constitution

During the *Frente Nacional* period (1958-1974), the rules of the political game constrained the role of congress in economic policy and enhanced the decision making capacity of the government.⁴² In practice, this restricted the policy options and facilitated the adoption of consensual macroeconomic policies.⁴³ There is no evidence of major macro policy reversals, while at the same time policies were rapidly adjusted in light of external conditions.

Presidents had a free hand to implement policy, even in the hypothetical absence of majorities in congress. As documented by Hartlyn (1981), the executive faced some opposition in congress during the *Frente Nacional*. Some factions opposed on ideological grounds, such as the MRL and ANAPO, and others for more ephemeral or specific reasons. Nevertheless, ample majorities were always secured, and presidents had leverage to pass their bills. Opposition was highest during the Misael Pastrana Administration (1970-1974), but even then it did not exceed 33% of congress (see Table 3).

Cabinet and governorships appointments were critical in the coalition forming process. The appointment of a prominent political leader in congress (typically a regional party boss) to the cabinet or a governorship was the most effective way of securing the coalition. Presidents had the difficult task of implementing the '*milimetría*', so cabinets and governorships had to have adequate representation by regions and political factions. In the case of cabinets, Table 4 shows the political affiliations of all ministers since 1970 at the beginning of each administration as well as two years later (half way into the term). Most presidents introduced significant changes at mid-term, several of them (e.g. Turbay, Barco and Samper) widening the representation of political groups⁴⁴. Normally, the liberal party has lost some representation in the cabinet during the second half, while the technocracy has been more important in administration with greater command of the majorities in Congress (Barco, López, and Gaviria). At the level of movements, the Pastranista wing of the conservative party has gained representation during the second half of the administrations, while the participation of the left has been minimal.

The rules of the political game embodied the Minister of Finance with immense power. As mentioned in the previous section, traditionally the Minister of Finance was not a politician, but almost always a professional economist. As Urrutia (1996) argues, liberal and conservative politicians would rather have a technocrat occupy this ministry than a potential rival. Other prominent actors for economic policymaking were the governor of the Central Bank and the manager of the Coffee Federation. The very nature of the power sharing agreement, as well as the usually long tenures of these key players, prevented opportunistic behavior and favored a long-

⁴² Congress was not totally excluded from economic policymaking. Tax reform formally was always in its hands, although governments used the State of Economic Emergency to bypass legislative discussion.

⁴³ See Hoskin, Leal and Kline (1976) and Hartlyn (1981).

⁴⁴ This does not imply that the effective number of parties in the cabinet (measured as in footnote 32) increased during the second half of the administration.

term perspective in policy making⁴⁵. The insulation of fiscal and monetary policies from political cycles was effective⁴⁶.

Interest groups (e.g. *gremios*) had a very active role in the PMP during that period. The president, after consultation with former presidents, along with representatives from the Church, the armed forces, and the parties' bosses, often invited the main private sector leaders for consultative sessions, in which important policy decisions were made, a tradition that is still regularly used today.

5.2 After the 1991 Constitution

The central implication of the 1991 constitution for the PMP is that although the president continues to initiate policies in the most relevant areas, congress is increasingly involved in their discussion, oftentimes introducing significant changes. The *gremios* have lost importance as key actors, in part as a result of a more market-oriented economy. This clearly has been the case of the Coffee Growers Federation, although in this case the loss of power has been aggravated by its declining economic importance. Former presidents have also lost significant ground as key players and may not be considered veto players, in part due to the fragmentation of congress and the relative loss of party discipline.⁴⁷

Congress, on the other hand, has strengthened its position as a key player enhancing its role in the policy-making process. By-passing congressional discussion –through the use of special powers- was severely curtailed by the constitution. In addition, the passage of legislation through congress has become more complex as a result of the increase in the effective number of parties. However, as shown in Table 5, presidents elected after 1991 have been able to secure a majority coalition in Congress, regardless of their political affiliation. The PMP does not end with the enactment of legislation in Congress. The CC acquired the status of a key and, on occasions, veto player in the PMP. The constitutional revision of laws allows the CC to intervene in critical areas, such as fiscal policy.

The introduction of the CC's review has furthered the transaction costs for the executive, which can no longer rely in "short term alignments" with congress to enact its policy. Although the president still retains exclusive rights of introducing economic bills, the polity has become more resolute with the presence of the CC as a powerful veto gate. Even if the executive can align its preferences with congress, the CC imposes the greatest difficulty for the President's attempt to change the status quo.

Another prominent actor in the economic PMP is the central bank board, given its constitutional responsibilities as authority on monetary and foreign exchange matters. These two areas of policy-making have traditionally been considered as highly specialized and both congress and the courts have had little involvement in its policy formulation. The significant

⁴⁵ It is possible to argue that the long term perspective in economic policymaking predates both the *National Front* and the emergence of the technocracy. However, we will restrict the analysis to the period that starts in 1958.

⁴⁶ See Escobar (1996) on the inexistence of political business cycles in Colombia.

⁴⁷ The 2003 referendum illustrates this well. Although former liberal presidents unanimously supported the referendum, the liberal party officially opposed it.

change undertaken as a result of the constitutional change that granted independence of the central bank is the diminishing influence of the executive in monetary decisions, despite the presence of the minister of finance as president of the board.

The PMP since the mid-1990s has also been influenced by the U.S. government. While the US-Colombian relations have been traditionally amiable and supportive of each other's interests, the drug problem and the domestic internal conflict -with potential regional repercussions- has put them in a new ground, as indicated by the approval of the U.S.-supported Plan Colombia in 1999. The U.S. influence has also been felt through the backing of the Colombian government economic programs, monitored by the IMF (since 1999).

It is worth adding that, despite the well-known insecurity situation of the country neither the armed forces nor the illegal groups have become veto players. The armed forces have been subordinate and supportive of the country civilian leadership. Presidents have replaced military commanders without hesitation when signs of unrest appear. Since the restoration of democracy in 1958, obedience to the president has never been an issue. On the other hand, the long-standing and military-strengthened guerrilla movement in Colombia has not had a veto capacity, even during the periods of peace negotiations. This is probably related to their negligible popular support.

5.3 The use of pork and the PMPs

Without doubt, budgetary allocations to specific projects promoted by the legislators are main tool that governments have used in order to secure the approval of important bills. These allocations were called *auxilios parlamentarios* prior to 1991. At one point they were subtly called *obras útiles y benéficas* (useful and beneficial works). The degree of transparency of the allocations has also varied according to the political environment. For example, during the 1970's the *auxilios* took the form of scholarships to students chosen by legislators. The mechanics involved in their approval and distribution has been more or less the following: At the time of the submission of the *Informe de Ponencia* before the committees, the sponsors in charge of bills of interest for the government approach the Finance Minister to express their concerns for their own constituencies and plea for an increase in the budget allocations for such regions. The size of the "pork", though not very transparent, varies with the relative importance of the project and the political support of the President. Nonetheless, the volume of *auxilios* has never been a major cause of the fiscal imbalances in the country. Though rules have changed, the distribution of the *auxilios* among regions and municipalities is closely related to the constituencies of key legislators in Congress.

The 1991 Constitution explicitly forbid the use of *auxilios parlamentarios*. In practice, however, governments and legislators have found ways of maintaining them if yet in a more hidden and less formal fashion. Until then, the distribution of pork was accepted and legal, and in some way more transparent. It is well-known that post 1991 successive administrations have used other forms, called *cupos* to get the approval of key reforms. Rather than involving direct budget allocations to legislators, the system now favors the channeling of funds to investment projects at the level of municipalities and departments were legislators control the administration

ore at the very least convene with mayors and governors the final use given to these funds. Strictly speaking, these allocations are unconstitutional, but control agencies have turned a blind eye to its practice. Moreover, several presidents have promised in their campaigns not to engage in these types of exchanges with congress. In practice, it has been impossible to deal with congress without the use of pork. The permanence of the *auxilios* despite the 1991 prohibition suggests the need to establish rules for the allocation of the national budget in a clear and transparent fashion.

5.4 The use of emergency powers and the PMP

The enactment of economic legislation, particularly taxes, through the use of emergency powers has traditionally been a highly debated and scrutinized process, but also a particular characteristic of the Colombian PMPs. The use of special legislative powers by the executive has a long history. Starting in 1905 after the Thousand Days War, and continuing until 2002 when the state of internal commotion was declared in order to introduce a wealth tax earmarked for defense and security, very few presidents have not used –or at least tried to use– the special powers.

Prior to 1991, the most commonly used exceptional state was the *Estado de Sitio*, which could be invoked with national or regional implications depending on the severity of the challenge to the public order. According to the data collected in Gallón (1978) and Cepeda (1985), presidents used this figure openhandedly, especially during the *Frente Nacional*. In fact, out of the four year term, president Lleras-Camargo (1958-1962) spent 3.4 years under regional or national *Estado de Sitio*, Valencia (1962-66) 1.2 years, Lleras-Restrepo (1966-70) 3.2 years, and Pastrana-Borrero (1970-74) 3.1 years.

The 1968 constitutional reform prohibited the use of the *Estado de Sitio* to legislate on economic matters such as taxes and introduced the *Emergencia Económica y Social* latter to deal with severe economic shocks. During the *Estado de Sitio* the president could change the budget, with the consent of the cabinet. The 1991 constitution eliminated this special state, and introduced the more restricted *estado de conmoción interior*, which was used for 180 days during de Gaviria (1990-04) and Uribe administrations (2002-present), and for 90 days during Samper's presidency (1994-1998).

However, from an economic point of view the most relevant special states are the ones related to economic and social emergencies. Measured as a proportion of the total number of the main economic laws enacted since 1982 (8 of a total of 189), or as a percentage of tax reforms (5 out of 43) the economic legislation passed with emergency powers appears extremely low. The significance of emergency legislation, therefore, lies in the very special conditions required for its application. The 1886 constitution restricted the enactment of legislation through executive powers to periods of war or internal commotion. The constitutional reform act of 1910, adopted after the Reyes dictatorship, explicitly established that no new taxes could be introduced with the exercise of special faculties except at times of war. This precept was not strictly followed during the Depression when the government was obliged to adopt economic legislation, including taxes, with exceptional regimes. A new constitutional interpretation introducing the concept of the

rupture of public economic order was introduced in the mid forties and formalized years later. The 1968 constitutional reform introduced article 122 which allowed for the possibility to adopt exceptional powers as a result of the rupture of economic and social order. This article was used to pass a profound and radical tax reform under the López Administration in 1974. However, the Supreme Court rejected in 1982 the adoption of new taxes through an economic emergency, during the Betancur Administration.

The 1991 constitution restricted even more the possibility to create new taxes using economic emergency provisions. New taxes could only be transitory during the period of the emergency and the resources used strictly for purposes of resolving the causes of the emergency. An attempt to use the economic emergency powers in 1997 by the Samper Administration was declared unconstitutional. Notwithstanding, two economic emergencies (during the Pastrana administration) and one internal commotion (during the Uribe administration) were able to introduce new taxes, with the approval of the Constitutional Court. Interestingly, in the three episodes the taxes introduced were temporary –according to the precepts of the constitution- but were later extended by normal-times legislation.

5.5 Recapitulating the key implications of the 1991 constitution for the PMPs

The starting point is that a number of important policy issues were directly included in the constitution so that they essentially became off limits in terms of the regular legislation. The PMP in these areas now takes the form of constitutional amendments which by definition are more difficult to pass than regular legislation⁴⁸. In addition, constitutional amendments, as well as regular lawmaking, have to face a more contested, fragmented and polarized congress. As we will document below, this has implied a lower probability of bills' approval in congress, specifically for bills initiated by the executive. Pre-1991, it was easier for the executive to put together a winning coalition because the president had greater partisan powers, and the legislature was less fragmented. Also, the loss of the president's power to appoint governors, the shift in the financing of campaigns (from party-based to candidate-based), and the use of a ballot system that lowered the value of the party, had a negative impact on party discipline and may have also made it more difficult for the president to enact his agenda. In addition, once the President is able to get laws passed through Congress, the constitutional revision by the CC can derail or modify what comes out of the legislative.

As before, presidents have been able to bypass legislative debate by invoking exceptional circumstances (*estados de excepción*). However, prior to 1991 emergencies were easier to declare. Post-1991, there are stricter checks on whether emergencies were declared appropriately (by the CC), and limits (in terms of the duration of the emergency and the type of legislative decrees that can be adopted). More relevantly, prior to 1991 decrees issued during the emergency became laws automatically, whereas now they have to go through the normal legislative approval process for them to remain in effect after the emergency expires.

⁴⁸ Article 375 of the constitution restricts the initiation of constitutional amendments to the executive, ten members of congress, 20% of city councils and departmental legislators, or 5% of the electorate. The amendments have to be discussed in two ordinary and consecutive legislative periods, approved in the first round by the majority of the legislators present, while second round has to be approved by the majority of the members of congress. In the second round the debate is limited to initiatives discussed in the first round. In contrast, regular laws require only one round and a simple majority of the legislators present in the debate.

Finally, the president's reactive powers in order to block legislation also changed. The president's veto power was weakened by the 1991 Constitution. Pre 1991 the president's veto was hard to overturn (required 2/3 of the votes). Post 1991, it is easier to overturn (requires only ½ of the votes).

6. Empirical evidence

This section provides some empirical content to the previous discussion by using a legislative output database covering the period between 1982/83 and 2002/03⁴⁹. Legislative output is the information about the bills that have been presented and enacted in a given legislature. The database consists of 3,428 bills presented in the House of Representatives, and comes –since 1992- from its annual *Informe Legislativo*. Prior to 1992, the information was collected from the archive at the Library of Congress⁵⁰. For each bill initiated, the database contains the following information:

1. Number of the bill
2. Title of the bill
3. Instance of entry into Congress (i.e., House or Senate)
4. Type of author (i.e. executive, legislative, other)
5. Party of the author
6. Name and number of legislator(s) presenting it to the floor (we will use the term *sponsor*)
7. Party of the *sponsor(s)*
8. Committee where it was introduced (including the possibility of joint committees)
9. Number of debates at the end of the legislative year
10. Status at the end of the legislative year (i.e., filed, cumulated⁵¹, in process, or enacted)

We focus on the variables that explain why bills become laws and compare the executive and legislative capacity of enacting policy before and after 1991. Specifically, we want to test whether the agenda setting power of the executive means greater success rates for bill initiated by the government, and whether this has changed after 1991. As shown in Table 6, on average 179 laws were initiated annually, prior to the enactment of the 1991 constitution. Since then, congressional activity has intensified: 271 laws have been initiated per year. Bills initiated by the executive represent around 19% of the total, regardless of the time period. It is important to mention that we use data from the House only. Nevertheless, we can follow the path of bills that go through the Senate which have been introduced in the House. Also, our unit of analysis is the bill instead of the legislator (as in the case of the databases constructed with roll-call data), so measuring party unity or party cohesion within congress is not possible with these data.

⁴⁹ See Mejia-Acosta (1998), Amorim-Neto (1997, 1998, and 2004) and Nacif and Morgenstern (2000) for similar data and analyses for other Latin American countries.

⁵⁰ The database is organized by legislative years, which start on July 20th and conclude on June 20th of the following calendar year (a recess goes from December 16th to March 16th). The years 1986 and 1987 were not complete in the archive. For these two years we have complete information only for the bills introduced in the first 6 months of the legislative year.

⁵¹ This occurs when several initiatives dealing with similar issues are cumulated into one.

To gain insight into the database, we borrowed Taylor-Robinson (1999) detailed typology to classify bills according to their scope: individual, local, regional, sectoral, national, and international treaties. This allows us to differentiate bills such as the “*celebración de los 462 años de la fundación del municipio de Charalá*” (PL.091/2002C) from bills that have a national or a sector-specific impact, such as those regulating professional activities. Bills that have a local or regional target are classified as ‘local scope’ in our database, while sectoral or national are classified as ‘national scope’. However, it is important to mention that these classifications are based on the limited information contained in the title of the bill, so care should be exercised when interpreting the results⁵².

Table 7 shows the distribution of bills by scope. As expected, the government basically submits bills with a national scope, while congress submits all types of bills⁵³. To compare the government and legislative success in enacting bills, we constructed a simple success ratio (enacted bills over bills introduced). This measure is imprecise because some bills are still being processed at the end of the legislative year, and have some probability of getting enacted in the following legislation. However, we do not know which laws in process during year t are effectively enacted in year $t+1$ ⁵⁴. Bills initiated by the executive systematically have higher success ratios for any type of scope. Bills initiated by legislators have relatively low chances of approval, especially in the case of laws with a local and national scope⁵⁵. Also, regardless of policy scope and initiation, success rates have fallen after 1991.

We also used a classification of bills according to their policy area. In particular, based on the bill’s title we classify them in the following areas⁵⁶:

1. Taxation
2. Budget
3. Foreign Trade
4. Financial markets
5. Monetary and exchange rate policies
6. Pensions
7. Other economic policies (e.g. agrarian reform)
8. Non economic.

Table 8 presents the results, where we aggregate categories 3, 4, and 5 as well as categories 6 and 7. As shown, budgetary bills have the highest success rate. In all cases, again, success rates drastically fell after 1991.

⁵² Even within bills with a national scope there is great diversity. Take, for example, the case of bill 183/2003C that seeks to establish the national day for forgiveness and reconciliation.

⁵³ Within the government, the ministers of Foreign Affairs and Finance are the leaders in terms of bill’s initiatives.

⁵⁴ Thus, we underestimate success ratios, compared to what could appear by looking at an entire four year presidential or congressional term.

⁵⁵ Saeigh (2003) calculates annual success rates for different regimes. When compared with that evidence, the Colombian executive has a lower success rate (40.6%) than other presidential systems, including Argentina (62%). In this context, Colombia looks more like Chile or Ecuador (1979 – 1996).

⁵⁶ However, when a bill deals with various topics, we make a judgment call on what constitutes its most salient topic.

6.1 Econometric tests and results

This section presents the results of a logit regression that uses as dependent variable the probability of a bill getting enacted. As mentioned above, at the end of the legislative year a bill can be enacted -this is what we call ‘success’ regardless of the impact of the law -, filed (which means that the initiative was defeated), or remain in process for consideration in the next legislative year. To avoid estimation biases we excluded bills that are still in process, mainly because it would be imprecise to treat them as cases of failure or success, as explained above. The model includes all legislative years in the database, with the exception of bills dealing with the ratification of international treaties -where congress essentially rubber-stamps negotiations conducted by the executive-⁵⁷. It is important to warn that the success ratio assumes every bill to be of same importance. For example, a tax reform is weighted equally as an honorific bill enacted by the legislature. More importantly, we treat as success the enactment of a bill, when it may be the case that the opposite is true.

The purpose of the econometric exercise is twofold. First, we want to identify the factors that determine success rates in legislative activity in general. Second, we want to disentangle the effects of the 1991 constitution. In particular, we explore the role of greater polarization and fragmentation –as well as lower presidential powers- discussed in the previous section. In all cases, the dependent variable takes a value equal to one in the case of initiatives that become laws, and zero otherwise. The explanatory variables include a dummy that takes a unitary value when bills are initiated after 1991 and zero otherwise (Post 1991), a dummy that takes a value of one when bills are initiated by the executive (Executive), a dummy with a value of one when the bill is initiated during the last year of the administration (Last Year), a dummy for bills that have a national scope (National), a dummy for bills that are discussed in the constitutional committee (Constitutional), a dummy for bills that are discussed in the economic committee (Economic), and a variable that measures each bill’s number of sponsors (Sponsors). In addition, we also used two variables that capture the polarization and fragmentation of the political system. This is the case of the effective number of political parties (Parties) and the number of lists competing in the previous election (Lists).

Table 9 presents the results. Equation 1, which tests our basic hypotheses, shows that success rates have fallen significantly after 1991, while bill initiatives originated by the executive have higher probability of success, relative to those initiated by congress. Interestingly, the interaction of these two variables has a positive and significant coefficient, suggesting that after 1991 the executive has been more effective in enacting laws than before, contrary to our analysis of the PMPs during that period. The other variables in the equation show that bills introduced during the last year of the administration and bills that have a national scope are less likely to pass, suggesting the presence of a ‘lame duck’ effect, and a bias in favor of laws that have a local or regional scope. Interestingly, bills that begin legislative discussion in the constitutional committee have a lower probability of success. This is important because as mentioned before, much of the PMP after 1991 requires constitutional amendments (due to the level of detail and specificity of the constitution) which by definition initiate the legislative discussion in the constitutional committees. Therefore, constitutional amendments are harder to pass than regular

⁵⁷ After excluding these bills, the number of observations in the sample falls from 3,428 to 2,278.

legislation. Bills that enter congress through the economic committees do not seem to be any different than the rest.

We already showed in Figure 9 that the number of sponsors assigned to each law has increased since 1991. As discussed above, the number of sponsors is a good proxy for the amount of pork that the executive has to deliver in order to pass a law. The hypothesis is that the greater the number of sponsors, the larger the amount of pork that the administration is willing to provide and the higher the chances of approval by the floor. This is precisely what we obtain in equation 2 when we add the number of sponsors as an explanatory variable. Importantly, the interacted term between the dummy post 1991 and the Executive variable loses all significance, suggesting that the more apparent success of the executive is the result of greater use of sponsors (i.e. pork) since 1991 to assist the legislative process. Equations 3 and 4 add the effective number of parties and the number of lists, respectively. As expected, both variables have a negative impact on the bill's chances of success, implying that greater fragmentation and polarization make the legislative process more difficult. All other variables remain significant, except in equation 4 for the Post 1991 dummy. This is interesting because it suggests that the decrease in the probability of success after 1991 is effectively explained by the increase in the number of lists (a measure of fragmentation), that has taken place since the enactment of the new constitution.

Transforming the estimated coefficients of equations 3 and 4 into marginal effects on the probability is a straightforward exercise which is shown in Table 10. According to equation 3 (which has the highest R squared), the estimated probability is 26.8%, which is marginally changed by changes in the explanatory variables. For instance, when the bill is initiated by the executive, the probability increases by 45.6%, when it is introduced during the administration's last year the probability falls by 16.6%, if it has a national scope the probability falls by 15.5%, while if initiates the debate through the constitutional committee the probability diminishes by 13.6%. At the same time, an extra sponsor raises the probability by 3.4%, while an extra political party lowers it by 16.1%. Figure 11 shows the partial effects on the probabilities of success of the relevant explanatory variables in the regressions, using as a benchmark bills initiated after 1991, during the first three years of the administration, through committees different than the constitutional committee and with a national scope. The charts show how the probabilities augment with the number of sponsors, and decrease with the number of parties and lists.

Finally, we performed a similar econometric exercise for different groups of bills sorted by policy area (Table 11). In the case of bills that deal with budgetary matters the Executive variable is very strong, as well as the number of sponsors. The other variables are less significant in this case (see equations 5 and 6). In the case of bills that deal with all other economic matters the negative effect of bills that deal with national issues appears to be relevant (equations 6 and 7). For bills that deal with non-economic issues (equations 8 and 9), the results are very similar to the ones described above in the context of equations 1 and 4.

In the remaining sections of this paper we describe the key policy characteristics, or in the project's terminology, the 'outer features' of some policy areas. With the purpose of exploiting variation across time and across sectors, we focus on specific aspects of fiscal, monetary, and exchange rate policies. The idea is not to provide a detailed account of these policies or a

complete taxonomy, but to identify those features and characteristics that can be related to the workings of the political institutions and the policymaking process. Given that lens, the implicit notion of optimal policy involves policies that are invariant to political shocks (or, more generally, to changes in the political landscape), but that are flexible enough to adjust to economic shocks. Finally, in the description we also highlight some specific aspects of these policy areas -different from the political institutions- that are useful in order to understand their 'outer features'.

7. Fiscal Policy

To identify the outer features of fiscal policy we will divide the analysis in three parts. We start by discussing fiscal policies in relation to oil and coffee exports. Analytically, this is a rich area due to variation across sectors (e.g. the number of relevant actors is larger in oil than in coffee) and time (e.g. coffee being a critical source of fiscal and foreign exchange revenues until the 1980's and oil thereafter). Secondly, we discuss issues related to the national government, which handles most of tax revenues and transfers an increasing share of those revenues to the regions. Thirdly, we look into pensions which are the fastest growing public expenditure.

7.1 Oil and Coffee

Public finances in Colombia have been highly dependent on coffee and oil taxation. In particular, coffee policy was a key component of fiscal policies before the enactment of 1991 constitution –specifically during the *Frente Nacional* years. Oil policy has been a key element of public finances in the post-1991 years⁵⁸. The constitution was written a time of major oil discoveries, explaining the generosity in terms of protection of social rights and lack of emphasis on aspects related to fiscal sustainability.

Here, we explore the policymaking processes through which coffee and oil revenues are distributed among different groups in society. Also, as these export revenues are intrinsically volatile, it is critical to reach intertemporal agreements for the implementation of consistent fiscal policies (i.e. policies that prevent overconsumption during booms). The outer features of the policies that address these issues are very different in the case of oil (post-1991), compared to coffee in the previous years, reflecting differences in the underlying political institutions, but also diversity in the specific characteristics of these two policy areas.

As mentioned in Section 4, the rules of the political game during the *Frente Nacional* facilitated complex intertemporal exchanges in economic policy. No other sector illustrates better these exchanges than coffee policy. In 1958, the same year that the *Frente Nacional* was agreed, world coffee prices collapsed sending producers into a deep crisis. That year, the National Coffee Fund (NCF) became the instrument for the stabilization of producers' incomes. By its very nature, stabilization implied savings during booms and dis-saving during busts. In either case,

⁵⁸ To put this in context, oil exports have represented on average 30% of exports after 1991, while coffee represented on average 50% of exports between 1958 and 1986 (and only 15% since 1991). Due to the collapse in world prices, and the diversification of exports, coffee has lost most of its fiscal and foreign exchange relevance in recent times.

cooperation was a prerequisite. Bates (1997) argues that coffee producers in Colombia have been traditionally at the center of the political spectrum. A candidate willing to win office requires the support of this group, which therefore has become pivotal in electoral turnouts. Consequently, liberal and conservative governments adopted similar policies in order to stabilize the effects of external shocks that were welfare-reducing for the median voter. Technocrats and coffee producers shared similar objectives and mutually reinforced their respective powers. The Minister of Finance (and, obviously, the President) and the leadership of coffee producers were the only relevant players in negotiating the intertemporal trades which involved a large part of the public finances.

According to the evidence presented in Cárdenas and Partow (1998), electoral and partisan cycles did not play a role in the redistribution of coffee export revenues to other groups. In this sense, the NCF was a flexible instrument that dealt with the amount of redistribution to other sectors and the degree of stabilization of domestic prices. Its decisions were the result of a two-player game (executive and coffee producers represented by the Coffee Federation), without the participation of other actors, such as congress or the courts. As a result of that interaction, coffee policies were stable (i.e. intertemporal agreements were sustained) and flexible (i.e. adjusted rapidly to changes in international and domestic conditions).

In light of the potentially destabilizing effects of an oil boom, congress approved in 1995 the creation of Oil Stabilization Fund (OSF). In contrast to coffee, redistribution is based on a rigid system of royalties allocated among the producing departments and municipalities (including those where the harbors are located) and the National Royalties Fund (NRF), which in turn redistributes to other departments and municipalities. Depending on the value of exports, the OSF forces saving by all the recipients of oil rents, and invests the proceeds abroad. The large number of players with power over a given decision (national and local governments, as well as Ecopetrol), the short-term nature of the interaction between the key actors (governors, majors and the executive), the high discount rate of these actors, and the difficulty in delegating policies to a third-party, create an environment with high transactions costs. The natural consequence is that the cooperative solution that provides some stability (i.e. savings during high export years) is embodied in rigid system of rules, costly to change even if those changes are desirable.

7.2 National Government

Total expenditures of the central administration have doubled from an average of 10% of GDP during the 1980's, to an average of 20% since 1999. As a result of eight tax reforms since the 1991 constitution, current revenues rose to 15.3% of GDP in 2003, from 8.8% in 1990. The net result has been an increase in the central government's fiscal deficit, especially after 1995. The adjustment measures adopted since 1999 (when the deficit reached a peak of 6.7% of GDP) have stopped –but not reversed– that trend. The growing gap between the overall and the primary deficit reflects the large increase in public debt and interest payments during the second half of the 1990s⁵⁹.

⁵⁹ Rincón et al. (2003) find that the component of the fiscal deficit that results from cyclical factors was relatively small between 1980 and 1994 (fluctuating between -0.2% and 0.2% of GDP), but that the rapid expansion of the economy between 1995 and 1997, raised revenues over their long-run structural trend, lowering the fiscal deficit in as much as 0.4% of GDP. Between 1999 and 2002 revenues fell below their long run value as a result

We argue that the capacity to conduct stable and predictable fiscal policies (i.e. avoiding and rapidly correcting deficits) has been severely hindered after the 1991 Constitution. This is not only the result of additional expenditures ‘imposed’ by the constitution⁶⁰, but the consequence of the reduction in the degree of flexibility and adaptability of fiscal policies. In turn, the greater rigidity in fiscal decisions is a natural response to the difficulty in reaching cooperative solutions in the environment created by the 1991 constitution, characterized by lower presidential powers and a larger number of relevant political actors. Along these lines, the report of the *Comisión de Racionalización del Gasto y de las Finanzas Públicas*⁶¹ (1997) argued that the “growing demand of government services (education, health, justice, security, etc.) and the absolute lack of consciousness on the part of society in relation to the limited resources available” are some of the principal causes of the “difficult fiscal situation” which is characterized by a ‘limited room of maneuver of the administration’ (p. 62). The Commission’s analysis, as well as many other papers that have followed, have identified interest payments, pensions, and transfers as the key components of government expenditures that ‘explain’ the large imbalances in the sense of having increased faster than revenues (see Figure 12)⁶².

On the revenue side, it is important to understand which are the underlying political and institutional factors that explain why tax reforms have been so frequent (on average every 20 months since 1990), distortionary (introducing anachronistic taxes as well as tax expenditures), and incomplete (never closing the gap with expenditures). The ‘outer features’ in this case suggest high volatility (there have been some policy reversals in relation to tax rates and exemptions), low coherence of tax policies (in the sense that there is very little consistency between reforms.), and low capacity to adopt structural reforms, that solve long-term problems with measures that have short-term upfront political costs, but high long-term payoffs.

Fiscal transfers to local governments

The process of decentralization has evolved rapidly since 1980. In Colombia, over 40 percent of total government spending is allocated by sub national governments, against an average of 15 percent in Latin America⁶³. Sub national governments are larger only Argentina and Brazil, the two federal countries in the region. Fiscal decentralization was pushed forward by the 1991 Constitution, that mandated a significant increase in fiscal transfers to the regions (mainly for education and health), to levels that are comparable to those of federal countries. Articles 356 and 357 of the 1991 Constitution ordered a gradual increase in territorial transfers, which were 29% of the central government’s current revenues in 1990 and were expected to rise

of the recession, adding between 0.2% and 0.4% of GDP to the fiscal deficit. These results are similar to those of Salazar and Prada (2003), but somewhat different from Caballero and Posada (2003).

⁶⁰ The 1991 Constitution was explicit about the need to increase expenditures, especially in the social sectors, with the idea of improving governance, while reducing the intensity of the conflict. Ocampo (2004) argues that the decision to raise expenditures, not only was deliberate but also had ample support, based on need to accelerate social progress while strengthening the democracy. Among the various possible ways to achieve these goals, the Constitution reinforced the model of fiscal and political decentralization, which had gained momentum during the 1980s. The Constitution also reformed the judiciary and imposed the obligation to subsidize public utilities to a large fraction of the population.

⁶¹ This bi-partisan and technical commission was set by the government in 1995. The purpose was to obtain a set of recommendations for the rationalization of government expenditures. The initiative came from some legislators during the discussion of the 1995 tax reform.

⁶² Payroll expenditures and general administrative expenses have remained relatively constant (in proportion to total revenues), while investment is the only item that has fallen (again relatively to total revenues).

⁶³ In contrast, local taxes account for about 19% of total taxes in the country.

to 46.5% by the end of that decade⁶⁴. In practice, fiscal transfers rose faster, to nearly 60% of current revenues, suggesting the presence of other factors beyond the constitutional mandate⁶⁵.

In July 1999, worsening economic conditions at home and abroad, led the Pastrana Administration to initiate formal talks with the IMF. The core of the agreed program was to lower the consolidated public sector (CPS) deficit to 3.5% of GDP in 2000, 2.5% in 2001, and 1.5% in 2002⁶⁶. The IMF program emphasized the need of a constitutional amendment to modify the fiscal transfers. Since the constitution these transfers were determined as a fixed share of total current revenues of the national government (which made tax reforms partly ineffective).

The amendment was finally approved by Congress in July 2001. The workings of that policy change illustrate well the incentives and constraints of the political actors. The initial proposal of the government was to replace the system with guaranteed 1.5% real annual increase in fiscal transfers (equivalent to population growth), regardless of economic conditions. In an effort to gather the sympathy of the political class, the government modified the initial proposal and introduced another article, extending the term in office of elected majors and governors from three to four years. Negotiations in congress raised real growth increase in fiscal transfers to 2% per year between 2002 and 2005, and 2.5% between 2006 and 2008⁶⁷. The end result is that the executive had to pay a high price (securing regions with a high growth rate in fiscal transfers) in order to gain a few years of independence between revenues and transfers⁶⁸. This shows that changing the rigid clauses of the constitution regarding fiscal transfers is politically costly. This, of course, limits the room of maneuver of the executive in economic matters, which cannot adjust expenditures at the local level to overall economic conditions.

However, other reforms introduced in the past few years have improved matters, as reviewed by Zapata, Acosta and Gonzalez (2001), by redirecting the use of the fiscal transfers. Law 549 of 1999, created FONPET (a national fund to cover primarily the pension liabilities of the regions) and forced most of the increase in fiscal transfers to the regions between 2000 and 2002, 20% of the revenues of the national royalties fund, and the resources from potential future privatizations to go to this Fund. Law 617 of 2000 created limits to the current expenditures of the local governments and has effectively reduced the fiscal deficit at the municipal and department level. Complementing the constitutional amendment, Law 715 of 2001 improved the criteria used for the allocation of fiscal transfers across local governments, using efficiency indicators (such as the enrollment rates or the actual population receiving health subsidies). To end with an optimistic note, this shows that reform has been possible on the margin. Reforms have improved the use and allocation of fiscal transfers, rather than providing some adaptability or flexibility to their overall level.

⁶⁴ According to Wiesner (1995), decentralization was conceived not only as a policy to induce efficiency from an economic point of view, but as a political instrument to allow greater participation or, more explicitly, as an escape-valve to release some of the pressures that had been built during the years of centralism. The process redistributed power from the national government to the municipalities and, to a lesser extent, to departments (Acosta and Bird, 2003). Critics emphasize low accountability and waste of resources (e.g., Echavaria, Renteria y Steiner, 2003) and the excessive imbalance of social spending on health and education, which has interfered with an efficient use of resources to reduce poverty (Perotti, forthcoming 2005).

⁶⁵ One of those factors is law 188, enacted in 1995, which incorporated new teachers into the system, reclassified them into higher-salary categories (effectively increasing salaries by 26% in real terms). The national government paid the bill through the *Fondo de Compensación Educativa*.

⁶⁶ At the end of 2002, the program was extended for another three year term.

⁶⁷ After 2009 transfers will grow at a rate equal to the real growth in current revenues of the central government during the previous four years.

⁶⁸ In addition, the amendment incorporated the *Fondo de Compensación Educativa* into the constitutionally mandated level of transfers.

Other examples of embedded rigidity

In a recent paper, Echeverry et al. (2004) discuss other sources of inflexibility in the central government's budget. They distinguish between mandatory expenditures and earmarked revenues. According to the 1991 Constitution, some of these revenues are considered *parafiscales* in the sense that they are spent by institutions not included in the budget approved by congress. As they rightly point out, these rigidities have a long tradition in the Colombian economic history. Almost every single minister of finance in the 20th century complained about the fiscal problems caused by congressional initiatives in relation to expenditures and earmarked taxation⁶⁹.

For the purpose of this paper it worth noting that apart from transfers to the local governments and pensions, earmarked expenditures currently represent nearly 1.7% of GDP. These expenditures cover almost every single sector (from sports to security), and are rigid in the sense that the budget law cannot change them. In relation to earmarked taxation the estimated figure for 2003 is 3.7% of GDP, suggesting that it is a larger problem. It is interesting to note that 79% of the existent earmarked rents were created after 1991, indicating that the rules of the political game favor this type of rigidity given the high political transactions costs. The recipients of these taxes are a myriad of funds, created for the development of specific regions and sectors. Recently, earmarked taxation has been used as a way of funding additional military expenditures.

High transaction costs also result in the constitutionalization of fiscal policies. A good example is wage policy in the public sector. Based on its interpretation of article 53 of the constitution (which says that minimum vital remuneration is a right), the CC has overruled the budget and has mandated minimum public-sector salary increases⁷⁰. Rigidities are so pervasive that the executive had to call a referendum in 2003 in order to freeze government expenditures for two years. The referendum failed.

Taxation

As discussed above, there has been a deliberate, although insufficient, effort to raise revenues in order to finance larger expenditures. The analysis of the contents of recent tax reforms, as well as the formal objectives established in the draft projects, confirm that the major objectives of the executive in the tax reform process have been the increase in tax revenues as a means of reestablishing fiscal balances. Even though the priority has been the increase in fiscal revenues, the draft tax reform projects submitted to congress have given importance to the structure of the tax system, an area in which governments have been only partially successful. There has been an increasing reliance on the VAT rate which has increased from 10% to 16% through the various reforms since 1990. However, the most recent attempts to increase the main VAT have systematically failed. More importantly, most of the draft projects submitted to congress have sought to widen the VAT base, with limited success.

⁶⁹ See the survey of *Memorias de Hacienda*, collected in Serna (1988).

⁷⁰ A ruling in 2000 established the previous year's inflation as the minimum increase. In 2001 a new ruling stated that for public employees with above-average salaries, the wage increase could be less than inflation (but positive in any case). In 2003, the Court determined that the minimum increase could not be less than 50% of inflation.

As a consequence of congress' reluctance to widen the income and VAT tax base, the executive has introduced new –and highly distortionary- tax sources. In 1998, a temporary 0.2% financial transactions tax was adopted through an emergency decree, which was raised to 0.3% and made permanent in the 2000 tax reform, and raised again to 0.4% in the 2003 reform. In the same vein, the Uribe government adopted through an extraordinary internal commotion decree a transitory net wealth tax earmarked to the strengthening of democratic security in Colombia. This tax was extended for three additional years in 2003. The conclusion is that revenue pressures have led to decisions that disregard the basic principles of an equitable and efficient tax structure.

The role of congress as a political actor in tax reform has been significant. While in earlier decades, congress largely rubber-stamped the tax reforms submitted by the executive, oftentimes through emergency legislation, its involvement in the design of tax packages has been increasing since the early 1990s. On the positive side, congress has been exemplary, to the extent that it has passed eight tax reforms since 1990. Also, congress has a solid group of distinguished members with knowledge and expertise on fiscal affairs who lead the debate and who are influential in the outcome of the legislation. On the negative, congress could be partly blamed for the insufficiency of revenues that come forth from the reforms, for the increase in expenditures and for the deficiencies in the structure of the taxing system. An analysis of tax legislation submitted by the executive reveals that congress tends to water-down the proposals during the debates, both in terms of revenues, but, more importantly, in terms of the quality of the reforms.

The growing involvement of congress in fiscal issues is also illustrated in the significant number of sponsors that are assigned to the analysis of the draft proposals from the executive. As discussed above, the interest in becoming sponsor also has to do with the distribution of pork, or with benefits obtained from the private sector as a result of political favors. The CC has also been a significant actor in tax policy outcomes. Tax issues have represented around 10% of the total legal claims on economic matters handled by the CC since 1991. As shown in Table 12, among the 50 most important rulings on economic matters made by the CC since 1992, 19 have dealt with fiscal issues. In 1999, the ruling on the financial transactions tax limited the scope in the use of resources. More recently, the CC denied the approval of the generalization of the VAT and the taxation of specific activities. At the same time, the CC has given its full legal support to important reforms.

7.3. Pension policy

As mentioned above, pensions have been the fastest growing public expenditure since 1991. The policymaking process provides another example of an entrenched status quo – unsustainable and unequal- yet extremely hard to reform. Law 100 of 1993, a major reform that had as its main goal the replacement of the pay-as-you-go defined benefit (DB) system for a defined contribution (DC) and individual capitalization scheme, illustrates well the workings of the political process. What came out of the legislative discussion is quite different from the initial government proposal. In particular, the DC regime is not mandatory for new entrants and was offered only as an alternative to the DB system. The reform scaled down some of the benefits of the DB system, especially by raising the retirement age, but the system is structurally unbalanced. In addition, the political compromise was to phase in very slowly the new conditions, which will

be fully effective only in 2014. Such a long transitional period has implied growing fiscal deficits. In addition, legislators, workers of the oil sector, teachers, and members of the armed forces, among others, kept their privileged pension regimes, something that has been impossible to change until today. The initial proposal, eliminated the DB system, leveled the benefits of all systems in 2004 and only excluded the military from the standard regime.

Even though the reform lowered the implicit pension debt by 38% of GDP, mainly as a result of the increase in contribution rates from 6.6% to 13.5% of wages: the fiscal costs of the new pension system were still unsustainable. As early as 1997, the report of the *Comisión para la Racionalización del Gasto Público* (1997), Ayala (1998), Clavijo (1998), among others, proposed shortening the transitional period, raising the retirement age, increasing contributions, reducing the replacement rate, and adopting stricter eligibility criteria. Although in the 1999 IMF program the Colombian authorities had made strict commitments to submit to Congress a second-generation pension reform, it was not until December 2002, under the Uribe administration, that the pension reform was finally approved in congress. Notwithstanding the high political capital of the new administration, the proposed increase in retirement ages starting on 2009 was rejected in congress. Contributions went from 13.5% of wages to 15.5% by 2006, while the minimum required number of weeks of contribution was increased. The replacement ratio was also reduced gradually from levels in the range of 65-85% to the range 50-70%, and new public workers were obliged to remain in the public pension system for at least the three initial years. Here also, the CC rejected some of the changes⁷¹.

Many aspects of the pension regime have been set by rulings of the CC. In order to deal with some of these features, the 2003 referendum included a specific question –which was not approved- proposing the elimination of all exempted and special public sector pension regimes and the alignment of all new entrants to the general pension regime as from 2008. Currently (2005) the government is promoting a constitutional amendment through congress. A balance of results in pension reform indicates this is a politically delicate and costly issue. As in the case of tax reform, draft proposal submitted by the administration are watered down in the congressional debate, especially in relation to changes in benefits. The conclusion is that the executive has initiative but without control on the final output.

8. Monetary and Exchange Rate Policies

8.1 Players

Before 1963 the decisions on monetary and exchange-rate policies were undertaken by a board chaired by the Minister of Finance with majority presence of prominent private sector bankers. In 1963, these policies were handed to the government-controlled Monetary Board, presided by the Minister of Finance and with the presence of other economic cabinet members, the central bank governor, and support from two technical advisors⁷². In practice, from 1963 to

⁷¹ The increase in the minimum number of weeks of contributions was declared unconstitutional, but it was approved again in the following legislature (Law 860/2003), which again was declared unconstitutional in 2004.

⁷² The board of the central bank was kept in charge of the administration of the Bank with continued presence of private sector bankers.

1991, monetary and exchange rate policy decisions were in the hands of the executive. Exchange rate policy from 1967-1991 was based on a crawling-peg regime, supported with a strict exchange control. The key policy decision -the rate of crawl- was made by the Minister of Finance in consultation with the President and transmitted to the Governor of the central bank for implementation.

The 1991 constitution (article 372) established the seven-member Central Bank Board as monetary and exchange rate authority. The members include the Minister of Finance, who presides it, the governor of the central bank, who is elected by the Board, and five independent members named by the President for a period of four years⁷³. Only two of the independent members can be changed every four years. The Board members, according to the constitutional mandate, must represent exclusively the interest of the nation. The major objective of the central bank is maintaining the purchase capacity of the currency or the control of inflation. Furthermore, the constitution established that lending to the government required the unanimous support of Board members.

Even though the Central Bank Board takes its decisions by a majority rule, where each member has one vote, the two most prominent actors within the Board are the Governor of the Central Bank and the Minister of Finance, both of whom act as de-facto agenda setters. The Governor instructs the bank's staff on the preparation and submission to the Board of the technical papers, which gives him great influence. Even though the Minister has only one vote in the Board decision process, in practice on exchange rate issues, the Board has almost always acted with the support of the Minister and very often at his request. On the monetary policy stance, decisions are made on a majority rule basis. Notwithstanding, on most occasions, the decision taken had the acquiescence of the Minister of Finance. Although the Minister of Finance is formally the person in charge of conveying the government's view on exchange policy and interest rate matters, it has not been uncommon, but rather the rule, that the President himself provides his own views on these issues.

In relative terms and compared to other Latin American countries, Banco de la República (central bank) had been relatively independent from other branches of government. Nevertheless, such independence was far from complete. In fact, monetary and exchange rate policies undertook a significant turnaround as a result of formal independence, established in 1991. Congress has fared well with the independence of the central bank to the extent that, in terms of executive-legislative relations, it gained relative power since in the financing of government, the executive would no longer be able to recur to monetary financing from the central bank and would be forced to recur to the legislative, both in the case of taxes and in authorizations to undertake public lending.

Congress also has an important role in the institutional organization but not in monetary and exchange rate policy formulation. In the first place, the Colombian constitution (article 371) explicitly establishes that the central bank should present reports to Congress on matters of responsibility to the Bank, which include exchange rate issues and the management of

⁷³ It has been argued that the presence of the minister of finance reduces the independence but enhances coordination. See Alesina (2004) for a critical analysis.

international reserves, and “on other issues that may be required”. The constitution also establishes that one of the roles of congress, besides dictating the central bank law that regulates the constitutional mandate to the Board, is its responsibility of determining the exchange rate ‘regime’. In 1991, Congress approved two important pieces of legislation regarding central bank board functions (Ley 31 de 1991) and the exchange rate regime (Ley 9 de 1991). On every legislative period, Congress discusses the Banco de República Reports and summons the Minister of Finance, the Governor and the Board members for difficult and strict questionings regarding central bank policies.

Initiatives to modify the central bank’s mandate have not been uncommon (see Table 13). However, only one initiative (out of seventy) was approved by congress, but it was later rejected by the CC. Two of these were debated in the Senate commissions and fourteen did not have any course through Congress. The one approved was presented by President’s Samper administration in 1996 and was clearly directed to modify the role of the Board of Banco de la República as the exchange rate authority of the country. Other initiatives have been geared towards the explicit acceptance of the “employment” objective as one of the main goals of the actions of the Board and to subject its members to a censure vote, a political action that Congress can apply to cabinet ministers. While it is true that the number of initiatives to change the exchange rate authority of the Central Bank Board has increased in recent years, it is also a fact that the number of legislators that try to push these initiatives through Congress is quite small. At the end of the day, however, Congress has not been successful in reforming the framework established by the Constitution in 1991 and by the central bank’s law of 1991 (Ley 31 de 1991).

Reference should be made on the role of the judiciary branch of government. Table 14, refers to the CC rulings that are thought to have had major implications upon economic policy making in Colombia. It can be seen that out of 50 major rulings by the CC between 1992 and 2003, covering a wide range of areas related to the economy, only six had to do with the workings of the central bank and one (N°481 of 1999) had a substantial implication for the Board., since the CC interpreted that the objectives of the Bank should include both inflation control and economic growth. Normally, the CC has ruled in favor of the central bank’s independence by limiting the role of the government in exchange rate and monetary matters. While defending that, the CC has also become more active in issues that were previously reserved to economic authorities, such as caps on mortgage interest rates. Regarding decisions made by Consejo de Estado, in general they have confirmed and reiterated the role of the Board of Banco de la República Board as the foreign exchange and exchange rate authority in the country. The major conclusion found in the case of the Consejo de Estado is that it has acted as an enforcer of inter-temporal agreements.

The role of multilateral organizations, particularly the IMF, as well as the US Treasury has also been important. In 1999, during the final stages of negotiation of the IMF program, both the IMF and the Treasury were of the view that Colombia should switch from the exchange rate band system to a flexible regime. This view ultimately prevailed. Colombian private sector interest groups, the academic community, the press and public opinion in general have limited influence on the formulation of exchange rate policy.

8.2 Framework

Before 1991, access to central bank liquidity facilities benefited greatly the government through monetary deficit financing. The system gave preferential credit access to particular activities, according to sector problems and pressures. Since 1991, the central bank is banned from extending direct loans to the private sector, except in the case of liquidity facilities to the financial sector. Although lending to the government is theoretically possible, it requires the unanimous vote of the board members.

On exchange rate matters, discontent with the old regime became evident around 1987. Urrutia (1994) notes that by the end of the 1980's the strongest argument for maintaining the controls was the fact that Colombia had only had one exceptional balance of payments crisis since the controls were adopted in 1967 (also no distinguishable interest group was being favored by the control scheme). Despite this, President Gaviria's reform proposal found support in congress and among public opinion because the effectiveness of the foreign exchange control system had decreased. Even though the crawling-peg regime coped with periods of booms and busts, it was unable to prevent prolonged periods of over and under-valuation of the currency. Besides, exchange controls provoked misallocation of resources.

Although it is tempting to suggest that monetary independence was a strategic decision by the constitutional assembly, in order to curb the fiscal deficit (especially after a constitution so rich in additional mandatory expenditures), the reality is that monetary reform was pushed directly by the central bank, inspired by the changing international attitudes towards monetary and exchange-rate regimes. According to the Washington Consensus, central bank independence gave priority to the control of inflation and prevented monetary financing of government fiscal deficit. The change in the central bank regime in Colombia was just one of a significant set of structural reforms covering taxes, labor, trade liberalization, decentralization, social security, and the financial sector adopted at the beginning of the nineties under the Gaviria Administration (see Edwards and Steiner, 2000).

Consequently, since 1991 Banco de la República has managed the exchange rate policy with large independence and flexibility. From 1994-1999 the Central Bank Board established an explicit exchange rate band. During that period, the Colombian authorities established controls on short-term capital inflows, of the Chilean type⁷⁴. It should be noted that since 1999 the determination of the nominal exchange rate has been more flexible, with some intervention by the Bank. On the monetary front, the central bank staff presents to the Board a monthly Inflation Report and recommendations on the policy stance. The decisions to adjust the central bank interest rates (i.e. Lombard and intervention rates) are made by the Board of Directors on a majority rule basis.

8.3 Features and outcomes

Monetary and exchange rate policies have tended to be stable in Colombia. In the pre-1991 years, political interference was limited to the president (and ministers in charge of

⁷⁴ Cárdenas and Barrera (1997) and Ocampo and Tovar (1999) discuss their effects.

agriculture and industry), while congress was excluded from this policy area. Post-1991, policies have been formally delegated and, thus, have become more independent. Volatility or policy reversals associated with changes in the political landscape have been avoided by the type of institutional design, which stresses large coordination between the executive and the monetary authority, which has always been high.

The possibility to accelerate the rate of the exchange rate crawl made the crawling peg regime, in principle, a very flexible system. Political constraints, however oftentimes did not allow the implementation of required adjustments in the nominal rate. This explains the failures to adjust and the prolonged periods of over and undervaluation observed. Post-1991, the exchange rate band system was managed in a more flexible way: Both the width of the band and its central parity were changed when fundamentals required it. Nonetheless, the system was still too rigid and a run on the currency occurred in 1999. Authorities moved to a flexible regime with explicit intervention rules. Without doubt, the current system has much less political interference.

Overall, the inflation-targeting framework adopted in 1999 allows for more flexibility when compared to the rigid rules that guided the increase in monetary aggregates, which prevailed since the 1960's. Inflation targeting allows the monetary aggregates to fluctuate according to the changes observed in money demand. It can be shown that the pre-1991 monetary framework presented lesser interest rate fluctuations, with the cost of having inflation rates in the range of 20%-30% from the 1960's to the mid-1990. With the adoption of the inflation-targeting framework, deliberate interest rate adjustments adopted by the Central Bank Board have been more frequent with resulting gains in terms of reducing inflationary expectations and achieving one-digit inflation.

A final distinguishing aspect between the pre and post-1991 regimes relates to differences in the policies' public or private regardness. The crawling peg system was often accompanied by multiple rates favoring specific groups. While a tax was generally imposed on coffee exports (and also on oil proceeds), importers of certain types of goods (i.e. capital imports) obtained foreign exchange at relatively more favorable terms. The actual flexible regime leads to a single market-determined rate for most goods and services. Also, subsidized credit was directed towards certain sectors of the economy that not always were chose on technical grounds.

Finally, it does not appear that changes of government in Colombia, or political ideology, have made a substantial difference in the way exchange rate policy has been conducted and implemented. Under the crawling-peg regime the variation of the nominal exchange rate responded to a discretionary management, but the real rate followed economic fundamentals. The behavior of the exchange rate between 1991 and 1999 and afterwards -when the exchange rate band was eliminated- was more strongly determined by fundamentals and market perceptions. There is no evidence that political pressures or party orientation had influenced the evolution of the exchange rate.

8.4 A general characterization of policies' outer features

Sections 7 and 8 of this paper have provided a detailed account of the outer features of fiscal, monetary, and exchange rate policies in Colombia before and after 1991. Table 15 summarizes the main findings. In the case of fiscal policies, the main changes are related to the adaptability of policies. In most areas, fiscal policies became more rigid after the 1991 constitution (except in the case of pensions where policies have been always rigid). There has been a slight deterioration regarding stability vis-à-vis political shocks, but also a marginal improvement in terms of public regardedness.

In regards to monetary and exchange rate management, after 1991 policies have been more isolated from political shocks. Compared to the period pre-1991, monetary policy has been (at least until 1999) less adaptable to external shocks, while the opposite was true for the exchange rate. There is more coordination/coherence in these two policy areas, and both have clearly gained in terms of public regardedness. An indication of this last point is the fact that special privileges, like differentiated exchange rates or subsidized credit facilities, were eliminated after 1991.

It is important to explore, in a cursory manner, other policy areas to provide a more general outlook of the effects of the 1991 constitution. Trade policy is an area that has remained relatively isolated from political changes, although is less used now than in the past to deal with economic shocks, for reasons that have to do with the trade agreements signed since 1991. Trade policies are still privately regarded in the sense of including some forms of protection that are not openly discussed outside the executive.

Regulation of public utilities is an area where much progress has been achieved since the 1991 constitution. The regulatory commissions operate with relative autonomy from the executive, although not to the point observed in monetary policies. These commissions have been able to a large extent –and with the important exception of the water commissions- to produce regulation that is stable and adaptable. However, the most important advancement in these areas is related to the public regardedness of the decisions made.

Finally, in the case of financial policies the main feature is related to the lower degree of stability, adaptability, and coherence since 1991. In some areas, like mortgage finance some decisions are in the hands of the CC, which by definition limits the response to economic shocks. Labor policies are still very rigid, although isolated from political shocks. Social policies have lost adaptability, as in the case of fiscal policies in general. To sum, the evidence is mixed. Some areas of policies show an improvement while in others there is deterioration. Clearly, in many policy areas the 1991 constitution brought positive changes. Therefore, the main problems are associated with fiscal policies.

9. Conclusions

At the end of the 1980s, the Colombian political institutions were under severe strain. Large segments of the population demanded more political participation and inclusion after decades of bi-partisan control. Regional political leaders –with the support of the electorate- advocated fiscal and political decentralization. The claim for increased security and political stability was particularly loud, after a decade of growing unrest and conflict that ended with the assassination of three presidential candidates in 1989. Moreover, the expectation of greater resources available for the discovery oil, as well as the exacerbation of social tensions, created momentum for the long-debated need of a new constitution. The sentiment around this issue captured the elections of 1990 that included an unofficial vote in favor of rewriting the constitution. The constitution enacted in 1991 became an escape valve that released some of the pressures that had been built in the previous decades. More sectors were brought into democratic life, the barriers for political participation were lowered, and regions gained autonomy and independence. In sum, after several failed attempts, the reform came from within the system.

The new political institutions had a significant effect on the policymaking process and the policy outcomes in a variety of areas. The constitution reduced presidential powers, enhanced the role of congress, lowered the costs of political participation and brought into the policymaking processes two new key players: the constitutional court and the board of the central bank. In addition, some policy areas –such as fiscal transfers, social expenditures, wages, and pensions, among others- were embedded in the constitution, restricting the room of maneuver of the executive. Moreover, in those cases in which there is some constitutional flexibility, the executive has faced a more divided and fragmented congress, which has increased political transaction costs and has lowered the probability of approval of bills. Apart from the quantitative aspect, bills that are approved are typically watered-down relative executive proposals.

In addition, the use of special legislative powers by the executive was severely restricted, while the regular constitutional review of laws is now more active, independent, and detailed. As a result, fiscal policies are less adaptable and flexible, precisely at the time when the economy faces larger external shocks than in the past. We argue that deconstitutionalizing some aspects of fiscal policy could improve policy outcomes in this area.

The reduction in presidential powers has also affected monetary policy. Although the president is still influential -through the presence of the minister of finance in the central bank's board-, policies often deviate from the preferences of the executive. Although disinflation has been the overriding goal of monetary policy since 1991, the evidence suggests that monetary policy has become more flexible and adaptable since 1999, the year when inflation returned to single-digit figures. In this case we do not propose major reforms to the political institutions that are relevant for monetary policy.

Recently, two constitutional amendments were approved. On the one hand, for the first time in Colombia's modern history, there was a successful attempt at reforming the electoral system for all legislative bodies. On the other, congress approved a constitutional amendment

which allows the president to run for a consecutive second term. Although there were attempts in Congress to extend the possibility of reelection to all executive offices (thus, including majors and governors), this was finally rejected.

These reforms will change the political institutions in important ways. From choosing across hundreds of lists, voters will choose candidates from single party lists. This will encourage formal pre-electoral coalitions and more policy based campaigns.⁷⁵ Although post-electoral coalitions will remain a relative salient feature of the system, due to the existence of preferential vote, the changes across party lines will imply more costs to members who decide to move from their pre-electoral coalition. Thus, as in Shugart et al (2005), we anticipate a reduction in the number of lists, a reduction on the number of wasted votes (especially after 2010), and a consolidation of a multiparty system.⁷⁶

In addition, as a result of reelection we expect an increased role of the president in congressional elections. Depending on the president's level of popularity, elections will serve voters to punish or reward the government as well as legislators that have aligned with the executive. It will also enlarge the probability of what we have called here 'the inter-temporal agreement', due to longer time horizon both for congressmen and the executive. The existence of a second term will reinforce the party organizations at the national level. However, the fact that reelection for other offices are not allowed might leave the local and regional party apparatus somehow disjointed from this process. In addition, the reelection of the president will limit the independence of the central bank.

The reform has already changed the incentives for political organizations. The 'independents,' for example, from being a disorganized group have already consolidated their forces in a very heterogeneous coalition –Polo Democrático- with electoral success. The traditional parties are trying to adapt to the new electoral system, but it remains to be seen if their effort at reinforcing discipline succeeds. In addition, legislative initiatives have started to insist on the importance of a statute for opposition.

The Constitutional reform of 1991 was an important attempt to restore representation and legitimacy to the political regime. However, as shown in our paper, the existence of excessive fragmentation and short-term horizons has had a negative impact on a variety of policies. Transactions cost have been high due to personalistic incentives and lack of organization. Most likely, the electoral reform will remedy in part the dysfunctionality of the party system. Hopefully, this will translate in more programmatic policy that reinforces the political party labels instead of personalistic agendas. Finally, the reelection will consolidate the power of the president as the main agenda setter in the policymaking processes.

⁷⁵ For a description and explanation of the changes and implications of the electoral reform, see Shugart et al. (2005).

⁷⁶ This effect is expected to be seen partially in local elections as well as national elections in 2006, due to the decision made by the Consejo Nacional Electoral. See, Reglamento 01/2003 por el cual regula el artículo 12 del Acto Legislativo No. 01 de 2003, in <http://www.cne.gov.co/>.

Table 1**Constitutional Presidential Powers**

	National Front and transition (1958-1980s)	After the 1991 Constitution (1991-2004)
Proactive powers	High decree powers, urgency petition, ex-post judicial review, areas of exclusive introduction of legislation (from 1968), declaration of unrestricted state of siege and state of economic emergency.	Restricted decree powers with ex-ante judicial review, call for joint permanent committees along with urgency petition. Declaration of state of siege for periods of 90 days, for a maximum of 180 days, subject to approval by the Constitutional Court
Integrative powers	Appointment powers in the governorships, various autonomous agencies, cabinet (highly centralized)	Appointment of the cabinet, autonomous agencies (highly decentralized)
Reactive powers	Required supermajority to override in economic bills (2/3 of the members of each House)	Required majority to override: 1/2 of the members of the House
Partisan powers	Relatively low due to consociational arrangement and electoral rules (quasi SNTV). Majority of 2/3 required in Congress (until 1974).	Extremely low: No nomination power, electoral rules. Non-concurrent elections - congressional elections first, majority runoff system.

Total number of ministers during term	28		33		29		41		47		37		47		39		19	
Average number of ministers per ministry	2,15		2,54		2,23		3,15		3,62		2,64		3,13		2,44		1,46	

Initial cabinet is according to the decree on the Inauguration' s day (August 7th). Mid-term is cabinet two years later.

(1) Mid-term is October 19, 1976.

(2) Initial date is August 10, 1986 because three Conservative ministers were appointed on the date of the Inauguration, but their party did not authorize.

(3) Mid-term is November 23, 1992. Noemi Sanin is considered as a representative of the official line of the Conservative Party, although she later became an independent and started her own movement.

(4) Mid-term is November 11, 2003.

Table 12

Constitutional Court Ruling With Major Fiscal Implications				
Type of Sentences	Year	Number	Topic	Decisión
Constitutional	1994	408	Objected law of social security (Law 100/93)	Unanimous
Constitutional	1994	520	Limits of the destination by sectors of the social cost of the territorial organizations	Four side vote
Constitutional	1996	511	Objected tributary amnesty (tributary benefits directed exclusively to weak people)	Unanimous
Constitutional	1997	219	Objected destination of originating resources of territorial tributes by means of law	One side vote
Constitutional	1999	136	Two by thousands. Objected tariff differentiated for financial operators	Three side votes
Constitutional	2000	1433	Indexing of wages of employees public	Two side votes
Constitutional	2001	404	Territorial Approved of requirements for external indebtedness of nation and organizations	One side vote
Constitutional	2001	540	Approved of the Law of territorial fiscal adjustment	Two side votes
Constitutional	2001	737	Vices of proceeding of the law that modified the regime of exemptions. Deferred effects	Four side votes
Constitutional	2001	1064	Greater margin for wage policies of servants public	Four side votes
Constitutional	2002	876	Approved tax to the patrimony by inner commotion	Three side votes
Constitutional	2003	155	Objected national valuation. Effects no deferred from the sentence	Four side votes
Constitutional	2003	776	Objected indiscriminate VAT (products of first necessity)	Unanimous
	2003	975	Limit to the pensional readjustment of magistrates (50% of the pension to 1994)	Unanimous
Constitutional	2003	1056	Objected regime of pensional transition (proceeding vices)	Three side votes
Constitutional	2003	1114	Approved (i) limit to free rents, (ii) compensation of fiscal losses of societies, (iii) regime simplified for retail retailers and lenders of services public, (IV) passage of the regime simplified to the regime common in the tax on the sales, (v) tariffs of the tax to the consumption of liquors, (vi) cession of the VAT of liquors to territorial organizations, (vii) tariffs of over-percentage to the gasoline, and (viii) new penal classification against the contraband	Unanimous
Constitutional	2003	1114	Objected the Bottom of Balance and Social Protection (proceeding vices - matter unit)	Unanimous
			Objected environmental over-percentage for terrestrial routes that affect the ecosystem (violation of the principle of legality of the tribute)	Unanimous
			Objected transitory allocation of exemptions that have not been approved of Exemptions (proceeding vices at heart National - matter unit)	One side vote
Constitutional	2003	1147	Objected the tax on the sales for the games of luck and chance (proceeding vices)	One side vote
Constitutional	2003	1152	Objected special tariff on the sale of the beer (proceeding vices)	One side vote
			Objected deduction of taxes of industry and commerce, and predial (proceeding vices)	Two side votes
Indirect Economic Incidence				
Constitutional	2003	1201	Approved the entailment of indebted shared in common of the tributary obligation, with the notification of the payment to order slip, with not need of which the constitution of additional individual titles is required	Unanimous
Constitutional	1992-2003	Total Major Sentences 50	All economic areas

Table 13**Legislative Initiatives To Modify The Central Bank Mandate**

Type of Proposal	Year	Initiative	Contents of Proposal	Result
Constitutional Reform	1996	Government (Samper)	Exchange Regime as Presidential Function	Not approved
Constitutional Reform	1996	Government (Samper)	Modifying Central Bank Objectives	Approved but rejected by Constitutional Court on Procedural Matters
Constitutional Reform	1999	Government (Pastrana)	Central Bank Functions Employment Objective	Without procedural course in Congress
Constitutional (Acto Legislativo 08)	1998	Congress (H.S. Camilo Sánchez)	Modifying Central Bank to functions article 373	Without procedural course in Congress
Constitutional (Acto Legislativo 76)	1998	Congress (H.S. Camilo Sánchez)	Censure motion to Central Bank Board Members	Without procedural course
Constitutional (Acto Legislativo 06)	1999	Congress (H.R. Pablo Ardila)	Censure motion to Central Bank Board Members	Retired
Constitutional (Acto Legislativo 06)	1999	Congress (H.S. Camilo Sánchez)	Central Bank Functions- Growth and employment Objectives	Without procedural course
Constitutional (Acto Legislativo 10)	2000	Congress (H.S. Flora Sierra)	Censure motion to Central Bank Board Members	Without procedural course
Constitutional (Acto Legislativo 203)	2001	Congress (H.R. Rafael Amador)	Modifying Central Bank functions	Without procedural course
Constitutional (Acto Legislativo 08)	2002	Congress (H.S. Camilo Sánchez)	Censure motion and Central Bank functions	Passed first Debate in Senate. Without additional procedural course
Legal (Proyecto 76)	1998	Congress	Central Bank Board Barred From Office	Without procedural course
Legal (Proyecto 83)	1999 2000 2002	Congress (H.S. Camilo Sánchez)	Central Bank Board Members Barred From Office	Without procedural course
Legal (Proyecto 178)	2001	Congress (H.S. Humberto Gómez)	Faculty to establish interest rate margin ceilings	Without procedural course
Constitutional (Acto Legislativo 12)	2003	Congress (H.S. Juan Fernando Cristo)	Central Bank Functions, Board Accountability, Bank Board Structure.	Approved by Senate Commission, without additional Procedural Course
Constitutional (Acto Legislativo 03)	2001	Government (Uribe – Political Reform)	Congress - Amendment to include censure motion to Board members	Amendment was retired from project
Constitutional (Acto Legislativo 168)	2003	Congress (H.R. Francisco Pareja)	Central Bank functions (employment)	Retired
Legal (Proyecto 235)	2003	Congress (H.R. Francisco Pareja)	Disqualification to	Retired
